APPENDIX G.3

Revision of Measure DD Configuration for Harrison Street / Lakeside Drive / 20th Street Triangle

AECOM

155 Grand Avenue, Suite 700, Oakland, CA 94612
T 510.763.2929 F 510.834.5220

Memorandum

Date: January 12, 2009
To: Margaret Stanzione, City of Oakland, Community and Economic Development
Agency
Tomas Schoenberg, The Swig Company, LLC
From: Jeffrey Chan, PTP
Subject: Revision of Measure DD Configuration for Harrison Street / Lakeside Drive / 20th
Street Triangle

This memorandum summarizes the proposed revision of the Measure DD configuration for the three intersections at the confluence of Harrison Street, Lakeside Drive, and 20th Street, herein referred to as the "Triangle." The analysis presented below considers the following two intersections, which would be most affected by implementation of Measure DD:

- 24. Harrison Street / 20th Street / Kaiser Center Access Road; and,
- 26. Harrison Street / Lakeside Drive.

The third intersection in the Triangle (Intersection #27: Lakeside Drive / 20th Street) would be removed with implementation of Measure DD and would operate without conflicting movements.

Measure DD Configuration

The aim of Measure DD is to enlarge Snow Park and provide enhanced pedestrian access to open space along the shore of Lake Merritt. As originally proposed, Measure DD would remove the 20th Street leg of the Triangle. The primary result of this reconfiguration would be the following changes in traffic flow in the Triangle:

- Eastbound-through vehicles (eastbound vehicles on 20th Street attempting to access Lakeside Drive) would need to first turn left onto northbound Harrison Street before turning right onto Lakeside Drive); and,
- Westbound-through vehicles (westbound vehicles on Lakeside Drive attempting to reach 20th Street) would first need to turn left at Intersection #26.

As Measure DD has already been approved, the Cumulative plus Project Conditions scenario presented in the Measure DD Implementation Project Environmental Impact Report (EIR) was assumed to be the cumulative base scenario for analysis of the Kaiser Center Redevelopment Project—i.e., Cumulative Conditions without the project. Project-related traffic was then added on top to generate Cumulative plus Project Conditions.

Cumulative plus Project Conditions (Kaiser Center Redevelopment Project EIR)

The LOS results for Cumulative plus Project Conditions for the Kaiser Center Redevelopment Project EIR are summarized in **Table 1**.

Table 1: Intersection Level of Service Comparison

| Intersection | | Existing Conditions | Cumulative Conditions | | Cumulative plus Project Conditions |
|--------------|----------------------------------|---------------------|------------------------------|----------------------------------|------------------------------------|
| | | Kaiser EIR (2008) | DD EIR (2025) ⁽¹⁾ | Kaiser EIR (2030) ⁽²⁾ | DD Geometry ⁽³⁾ |
| AM Peak Hour | | | | | |
| 24 | Harrison Street / 20th Street | D 40.6 | C 25.2 | C 28.4 | F 272.8 |
| 26 | Harrison Street / Lakeside Drive | A 7.6 | C 23.3 | C 23.8 | C 26.3 |
| PM Peak Hour | | | | | |
| 24 | Harrison Street / 20th Street | C 34.1 | C 22.5 | D 47.9 | F 255.9 |
| 26 | Harrison Street / Lakeside Drive | B 13.1 | C 25.3 | D 53.0 | E 66.2 |

Notes:

Bold indicates intersections operating at **LOS E** or **LOS F**.

⁽¹⁾ Cumulative plus Project Conditions as presented in the Measure DD Implementation Project EIR.

⁽²⁾ Cumulative Conditions for the Kaiser Center Redevelopment EIR, assuming identical geometry at Measure DD intersections (#24 and #26) as that presented in the Measure DD Implementation Project EIR for Cumulative plus Project Conditions.

⁽³⁾ Assumes minor timing and phasing adjustments to accommodate the additional southeastbound approach to be constructed at Intersection #24 as part of the project. An additional eastbound left-turn pocket would be provided, as the existing pocket immediately before the intersection would be removed. Cycle length, however, is assumed to remain constant.

As shown in **Table 1**, the project would contribute to significant cumulative impacts under both the AM and PM peak hours at the intersection of Harrison Street / 20th Street. The project would also potentially contribute to a significant cumulative impact under the PM peak hour at the intersection of Harrison Street / Lakeside Drive.

In order to mitigate the project's contribution to cumulative impacts at the intersection of Harrison Street / 20th Street, the following changes would be required:

- For the AM peak hour, an additional southbound-through lane would be needed, with timing adjustments to increase the green time to this movement.
- For the PM peak hour, the following changes would need to be made:
 - The southeastbound approach (the internal access road) would need to be reconfigured from a through-left and exclusive right to an exclusive left, exclusive through, and exclusive right; and,

- The northbound approach (Harrison Street) would need to be reconfigured from a shared left-through-right and exclusive right to an exclusive left, exclusive through, and two exclusive rights.

These changes would be in addition to the “basic” changes necessitated by the new approach, as detailed in Note #3 of **Table 1**. After these changes, the two intersections would operate at acceptable levels of service.

Microsimulation Analysis

Because of the proximity of the intersections of Harrison Street / 20th Street and Harrison Street / Lakeside Drive and the resulting potential for queuing impacts, a preliminary microsimulation analysis of the roadways and intersections in the immediate vicinity of the project was conducted. The microsimulation analysis concluded the following:

- Substantial queuing would occur on the following movements after reconfiguration:
 - All movements on the northbound approach at Harrison Street / 20th Street, especially the northbound-left and northbound-right movements;
 - All movements on the southeastbound approach (internal access road) at Harrison Street / 20th Street;
 - Eastbound-through movement at Harrison Street / Lakeside Drive (Harrison Street to Harrison Street), leading to spillback queuing affecting throughput at Harrison Street / 20th Street;
 - Southbound-left movement at Harrison Street / Lakeside Drive (Harrison Street to Lakeside Drive), leading to spillback queuing affecting throughput at Harrison Street / 21st Street; and,
 - Northbound-through movement at Harrison Street / Lakeside Drive (Lakeside Drive to Harrison Street).
- The removal of the eastern 20th Street leg at Harrison Street / 20th Street introduces traffic flow conflicts between northbound Harrison Street vehicles bound for Grand Avenue and I-580 and eastbound 20th Street vehicles attempting to access southbound Lakeside Drive to reach 11th / 12th Streets and I-880. This increases the potential for collisions as vehicles attempt to weave into the appropriate lane or make sudden lane changes and turning movements over short distances.

Improvement Measures

Based on the microsimulation analysis, the reconfiguration of the Harrison Street / Lakeside Drive / 20th Street Triangle as originally proposed by Measure DD would result in substantial queuing issues and weaving conflicts as detailed above. These issues would be complicated by the addition of project-generated traffic.

As a possible alternative configuration, it was proposed that the Lakeside Drive section of the Triangle be removed instead. This would present the following benefits:

- Complete removal of one intersection from the roadway network, streamlining traffic flows. The reconfiguration as originally proposed by Measure DD would have removed the 20th Street section of the Triangle, but the intersection of Harrison Street / 20th Street would still have remained because of the presence of conflicting movements.

Ms. Margaret Stanzone

Mr. Tomas Schoenberg

January 12, 2009

Revision of Measure DD Configuration for Harrison Street / Lakeside Drive / 20th Street Triangle

Page 4

- Elimination of the intersection queuing and associated spillback queuing impacts at the intersection of Harrison Street / Lakeside Drive. The alternative configuration would result in approximately 600 feet of unobstructed queuing storage along Harrison Street.
- Elimination of the weaving conflicts and potential for collisions discussed previously, as eastbound-through vehicles from 20th Street would no longer have to use Harrison Street to access Lakeside Drive.
- Placement of the new open space where it results in the most benefits. The original proposal called for Snow Park to be expanded, but the new open space would still be separated from Lake Merritt by Lakeside Drive. The alternative configuration removes the Lakeside Drive section of the Triangle and allows existing open space abutting the lake to be expanded west. This reduces the number of crosswalks by one for pedestrians attempting to access the lakeshore from 20th Street west of Harrison Street and enhances the attractiveness of the shoreline area as a lunchtime or recreational spot for employees in nearby office buildings.
- Improved options for project-related traffic, as the alternative configuration improves connections to Lakeside Drive for vehicles coming to and from the internal access road.

The alternative reconfiguration would require changes to lane striping and configuration and signal timing and phasing. The alternative reconfiguration would also likely result in higher delays and poorer level of service (LOS) at the intersection of Harrison Street / 20th Street than the original reconfiguration. Given, however, that it would produce the benefits described above, particularly the improvement of non-auto access to open space—a primary goal of Measure DD—it is recommended that the analysis proceed assuming the alternative configuration.

Next Steps

AECOM will conduct a microsimulation analysis under Cumulative plus Project Conditions of intersections immediately adjacent to the project site and develop a preliminary design for the intersections of Harrison Street / 20th Street, Harrison Street / Lakeside Drive, and, potentially, Harrison Street / 21st Street. The preliminary design will include the following elements:

- Intersection geometry;
- Roadway geometry;
- Signal timing plans;
- Signal phasing plans; and,
- Any additional considerations such as off-peak access to the parking garage, access to the loading docks, pedestrian access, and bikeway facilities.

The proposed design will be presented to City of Oakland Community and Economic Development Agency (CEDA) and Transportation Services Division (TSD) staff for preliminary approval before proceeding with the rest of the analysis.

APPENDIX G.5

Mode Split Findings

AECOM

155 Grand Avenue, Suite 700, Oakland, CA 94612
T 510.763.2929 F 510.834.5220

Memorandum

Date: October 17, 2008

To: Margaret Stanzione, Community and Economic Development Agency,
City of Oakland
Gordon Lum, Transportation Services Division, Community and Economic
Development Agency, City of Oakland

From: Jeffrey Chan, PTP

Subject: Kaiser Center Redevelopment Project Transportation Impact Analysis –
Mode Split Findings

This memorandum summarizes the findings from the comparison of mode split and average vehicle occupancy (AVO) results contained in various technical sources documenting travel behavior for the Downtown area in the City of Oakland⁽¹⁾. The results of the comparison facilitate the determination of the most suitable mode split and AVO to be used for the proposed Kaiser Center Redevelopment Project located in the City of Oakland, herein referred to as the Project.

Project Description

The proposed project would primarily consist of two new office towers totaling 1,320,000 square feet of office space adjacent to the existing Kaiser Center office tower, located on the west corner of the block bounded by 21st Street on the north, 20th Street on the south, Webster Street on the west and Harrison Street / Lakeside Drive on the east, herein defined as the "Kaiser Center block." Approximately 48,000 square feet of existing retail space would be removed and replaced with 46,000 square feet of retail located at street level along 20th Street and Webster Street and on the sixth floor adjacent to the existing Kaiser Center rooftop garden.

The project is divided into two phases:

- Development Phase I consists of the 42-story North Tower in conjunction with the street level retail complex along Webster Street, comprising approximately 768,000 square feet of office space and approximately 19,000 square feet of retail space located at street level and on the sixth floor; and,
- Development Phase II, which would be commenced concurrently with or following Development Phase I, consists of the 34-story South Tower in conjunction with the street level retail complex along 20th Street, comprising approximately 552,000 square feet of office space and approximately 27,000 square feet of retail space located at street level and on the sixth floor.

⁽¹⁾ Downtown is defined in the Land Use and Transportation Element of the General Plan (page 67) as the area generally bounded by West Grand Avenue to the north, Lake Merritt and Channel Park to the east, the Oakland Estuary to the south, and I-980 / Brush Street to the west.

A total of 48,000 square feet of existing retail space would be demolished as part of the project. The removal of retail space would be spread across the two phases.

In summary, the overall project (Phase I and Phase II) proposes the following net changes in land use to the Kaiser Center block:

- Increase of 1.32 million square feet of office space; and,
- Decrease of 2,000 square feet of retail space.

The project also proposes new subterranean and above-grade parking consisting of an additional 697 parking spaces. The new parking structures would be incorporated into the existing Kaiser Center Garage. Pedestrian entrances to the office towers would be located on Harrison Street, Webster Street, and 20th Street, while vehicular entrances to the project complex would be via driveways on Harrison Street, 20th Street, and 21st Street. Vehicular access to the garage structure would be provided via the existing entrances and exits located on 21st Street and via the access road on the eastern portion of the block (entrances currently via Harrison Street, 20th Street, and 21st Street).

Data Sources

The mode split and AVO findings were compiled from four different sources with various publication / completion dates:

- *Standard Operating Procedure: Technical Guidelines for Transportation Impact Study*, published by the City of Oakland Community and Economic Development Agency's (CEDA) Transportation Services Division (TSD) in March 2007;
- *Alameda County Congestion Management Agency (ACCMA) Transportation Survey* for the Oakland City Center Complex, commissioned by the Alameda County Congestion Management Agency (ACCMA) in May 1993;
- *Downtown Transportation and Parking Plan*, compiled by Dowling Associates for CEDA and the City of Oakland Redevelopment Agency in October 2003; and,
- Journey to Work Surveys for the 2000 U.S. Census, compiled by the U.S Census Bureau in May 2000.

The results of the mode split and AVO findings from these four sources are summarized in **Table 1**.

Normally, the City of Oakland CEDA TSD has specific mode splits contained in the TSD Guidelines, which are deemed appropriate for projects in Downtown Oakland and account for the extensive transit facilities available in the Downtown area. However, as shown in **Table 1**, different areas of Downtown exhibit different mode split characteristics. These differences are partly a result of the variability in the degree of accessibility by transit facilities, with the City Center Complex being the most accessible by transit facilities and areas north of Downtown being less accessible by transit facilities. The differences are also likely due in part to the availability and cost of parking in the area, with the City Center Garage at high occupancies despite relatively high cost compared to other parking facilities in the Downtown area.

In order to adequately evaluate the potential impacts to area transit facilities due to the Project, it is evident that an alternative mode split would be needed to account for the extensive transit facilities in the vicinity of the Project. In addition, the mode split contained in the TSD Guidelines has a much higher automobile split of 83 percent, compared to the other sources outlined in **Table 1**, which range from 42 percent to 66 percent.

Table 1: Mode Split and Average Vehicle Occupancy Summary

| Data | | Source | | | | |
|---------------------------------|---------|--|------------------------------------|---|---------------------------------|---------------------------------|
| | | Oakland CEDA TSD Guidelines ^(a) | ACCMA Travel Survey ^(b) | Downtown Transportation and Parking Plan ^(c) | | 2000 U.S. Census ^(d) |
| Area of Downtown | | Entire Downtown | City Center Complex ⁽¹⁾ | City Center Complex ⁽¹⁾ | Rest of Downtown ⁽²⁾ | Entire Downtown |
| Mode Split | Auto | 83% | 65% | 42% | 66% | 54% |
| | Transit | 17% | 30% | 55% | 30% | 27% |
| | Other | -- | 5% | 3% | 4% | 19% |
| Average Vehicle Occupancy (AVO) | | -- | 1.48 ⁽³⁾ | 1.13 | 1.16 | 1.16 |

Source:

(a) *Transportation Impact Study (TIS) Technical Guidelines* - Section 3B, Transportation Services Division, dated March 9, 2007.

(b) *Alameda County Transportation Survey – City Center Complex, Oakland* (ID Number: 10-7-1), data collected May 1993.

(c) *Downtown Transportation and Parking Plan*, Dowling Associates, dated October 2003.

(d) Average of Census Tracts 4013, 4028, 4029, 4030, 4031, 4033, 4034, 4035, and 4036 from the 2000 U.S. Census.

Notes:

(1) "City Center Complex" is defined as the area of Downtown Oakland bounded by 14th Street to the north, 8th Street to the south, Broadway to the east, and Martin Luther King, Jr. Way to the west.

(2) "Rest of Downtown" is defined as the remainder of Downtown Oakland excluding the City Center Complex.

(3) Adjusted average vehicle occupancy.

Upon reviewing the mode split results contained in the four sources, it was determined that the mode split and AVO results from the 2000 U.S. Census would be inappropriate for the purposes of transportation impact analysis for the Project, as the survey compiled information for home-based work trips originating in Downtown Oakland—i.e., trips by residents living in Downtown Oakland. The two other surveys—conducted by ACCMA and by Dowling Associates—were compiled for work trips terminating in Downtown Oakland—i.e., trips by people who work in Downtown Oakland. As the Project land use program consists of office and retail uses, the 2000 U.S. Census results would not be appropriate.

In addition, it was determined that the mode split and AVO results contained in the transportation survey for the Oakland City Center Complex commissioned by ACCMA in May 1993 are superseded by those contained in the *Downtown Transportation and Parking Plan* compiled by Dowling Associates in October 2003. Specifically, the Dowling Associates study evaluated a specific survey subarea coinciding with the area surveyed for the City Center Complex transportation survey by ACCMA. The survey methodologies were also similar, consisting of paper survey forms distributed to employers in the Oakland City Center Complex. Since the Dowling Associates study was completed in October 2003, the study and its associated results for the Oakland City Center Complex effectively supersede and replace those of the ACCMA transportation survey from 1993.

Finally, it was determined that the mode split and AVO results for the "Rest of Downtown" area from the Dowling Associates study would be the most appropriate due to the survey being the most recent and most applicable in terms of location. The "Rest of Downtown" area is generally well-served by transit facilities but includes areas with varying degrees of transit accessibility, with some areas less accessible to transit facilities than others, unlike the City Center Complex, which is immediately adjacent to the Oakland City Center / 12th Street BART Station. It is important to note that in the survey, "Rest of Downtown" area includes the following areas:

- Old Oakland, in the vicinity of Washington Street / 8th Street, within three blocks of the Oakland City Center / 12th Street BART Station;

- Metro Center, in the vicinity of Harrison Street / 8th Street, adjacent to the Lake Merritt BART Station;
- County Center, in the vicinity of Oak Street / 14th Street, within six blocks of both the Lake Merritt BART Station and 12th Street BART Station; and,
- Upper Downtown, in the vicinity of Harrison Street / 20th Street, adjacent to the Project and within two blocks of the 19th Street / Oakland BART Station.

It must be stressed that for the transportation surveys distributed in Metro Center, County Center, and some Upper Downtown office buildings such as the Caltrans Building, the transit mode share tended to be higher than other office buildings in the “Rest of Downtown” area, as the aforementioned office buildings contain offices of State and County public agencies. State and County agencies provide transit subsidies as part of employee benefits, therefore resulting in a higher transit mode share than typically observed at other office buildings.

Therefore, it would be most prudent to use the mode split and AVO results from the *Downtown Transportation and Parking Plan* compiled by Dowling Associates in October 2003, with a mode split of 66 percent automobile, 30 percent transit, and 4 percent other to be used in the Transportation Impact Analysis for the Project. These numbers would be used in lieu of the standard mode split of 83 percent automobile and 17 percent transit as outlined in the City of Oakland CEDA TSD Guidelines. To simplify the analysis, a mode split of 70 percent automobile and 30 percent transit was assumed in all trip generation calculations.

Travel Demand Model Land Use Findings

This memorandum summarizes the findings from the comparison of land use (LU) information contained in the Alameda County Congestion Management Agency's Travel Demand Model (ACCMA Model), CUBE Version 2007, based on Association of Bay Area Governments' (ABAG) and Metropolitan Transportation Commission's (MTC) *Projections 2005* LU information.

ACCMA Model *Projections 2005* Land Use Information

The ACCMA *Projections 2005* LU information allocations represent estimates of existing (Year 2005) and future development (Year 2030) in Alameda County. This land use information was assembled during April 2005 through June 2006. The source data were obtained solely from secondary sources such as Census 2000 counts and estimates, the *Census Planning Package 2000*, development capacity and growth projections from General Plan studies, and comments submitted by local jurisdictions.

The final LU allocations in the ACCMA Model for Year 2030 were adjusted to maintain close compliance to the county-wide control totals, within one (1) percent variance from ABAG and MTC *Projections 2005* control totals, as specified by MTC's publication *Guidance for Consistency of Congestion Management Programs with the Regional Transportation Plan*.

The *Projections 2005* LU information contained in the ACCMA Model for the Transportation Analysis Zones (TAZ) within the City of Oakland (City) were summarized for Year 2005 and Year 2030, aggregated by number of households and number of employment by category. **Table 1** summarizes the LU information in the ACCMA Model for the City, with the ABAG control totals for the City also presented for comparison purposes.

Table 1: ACCMA Model Projections 2005 Land Use Information – City of Oakland

Source: Alameda County Congestion Management Agency, 2006; Association of Bay Area Governments, 2005; AECOM, 2009.

Note: n/d denotes no data available.

As shown in **Table 1**, the ACCMA Model Projections 2005 LU information for TAZ within the City are within one (1) percent variance of the ABAG Projections 2005 control totals for both residential and employment LU information types, for both Year 2005 and Year 2030, as specified by the MTC. Therefore, it was prudent and reasonable to use ACCMA Model citywide LU information projections for Year 2005 and Year 2030 for the purpose of traffic projections for the Kaiser Center Project (Project) Transportation Impact Analysis (TIA).

Project Vicinity – Area of Influence

As recommended in the *Mode Split Findings Memorandum* dated October 17, 2008, the Upper Downtown⁽¹⁾ portion of the “Rest of Downtown” area, as specified in the *Downtown Transportation and Parking Study Report* completed by Dowling Associates in October 2003, contained travel characteristics most suitable for the purpose of the Project TIA. This project vicinity area also contains LU information that are expected to have the most influence on travel demand projections for the purpose of Project TIA.

Specifically, the Upper Downtown area, in the vicinity of Harrison Street / 20th Street, adjacent to the Project and within two (2) to three (3) blocks of the 19th Street / Oakland BART Station, contains the Project and other approved, pending, and concurrent developments, is chosen as the area of influence for LU information comparison purposes.

In terms of geographic features, the Upper Downtown area is bounded by Grand Avenue to the north, Lake Merritt to the east, 14th Street to the south, and San Pablo Avenue to the west. Technically, the Upper Downtown area is comprised of twelve (12) ACCMA Model TAZ – TAZ 219 to TAZ 225, TAZ 228 to TAZ 231, and TAZ 279. **Figure 1** shows the Upper Downtown area TAZ locations in relation to the rest of the City.

⁽¹⁾ Downtown is defined in the Land Use and Transportation Element of the General Plan (page 67) as the area generally bounded by West Grand Avenue to the north, Lake Merritt and Channel Park to the east, the Oakland Estuary to the south, and I-980 / Brush Street to the west.

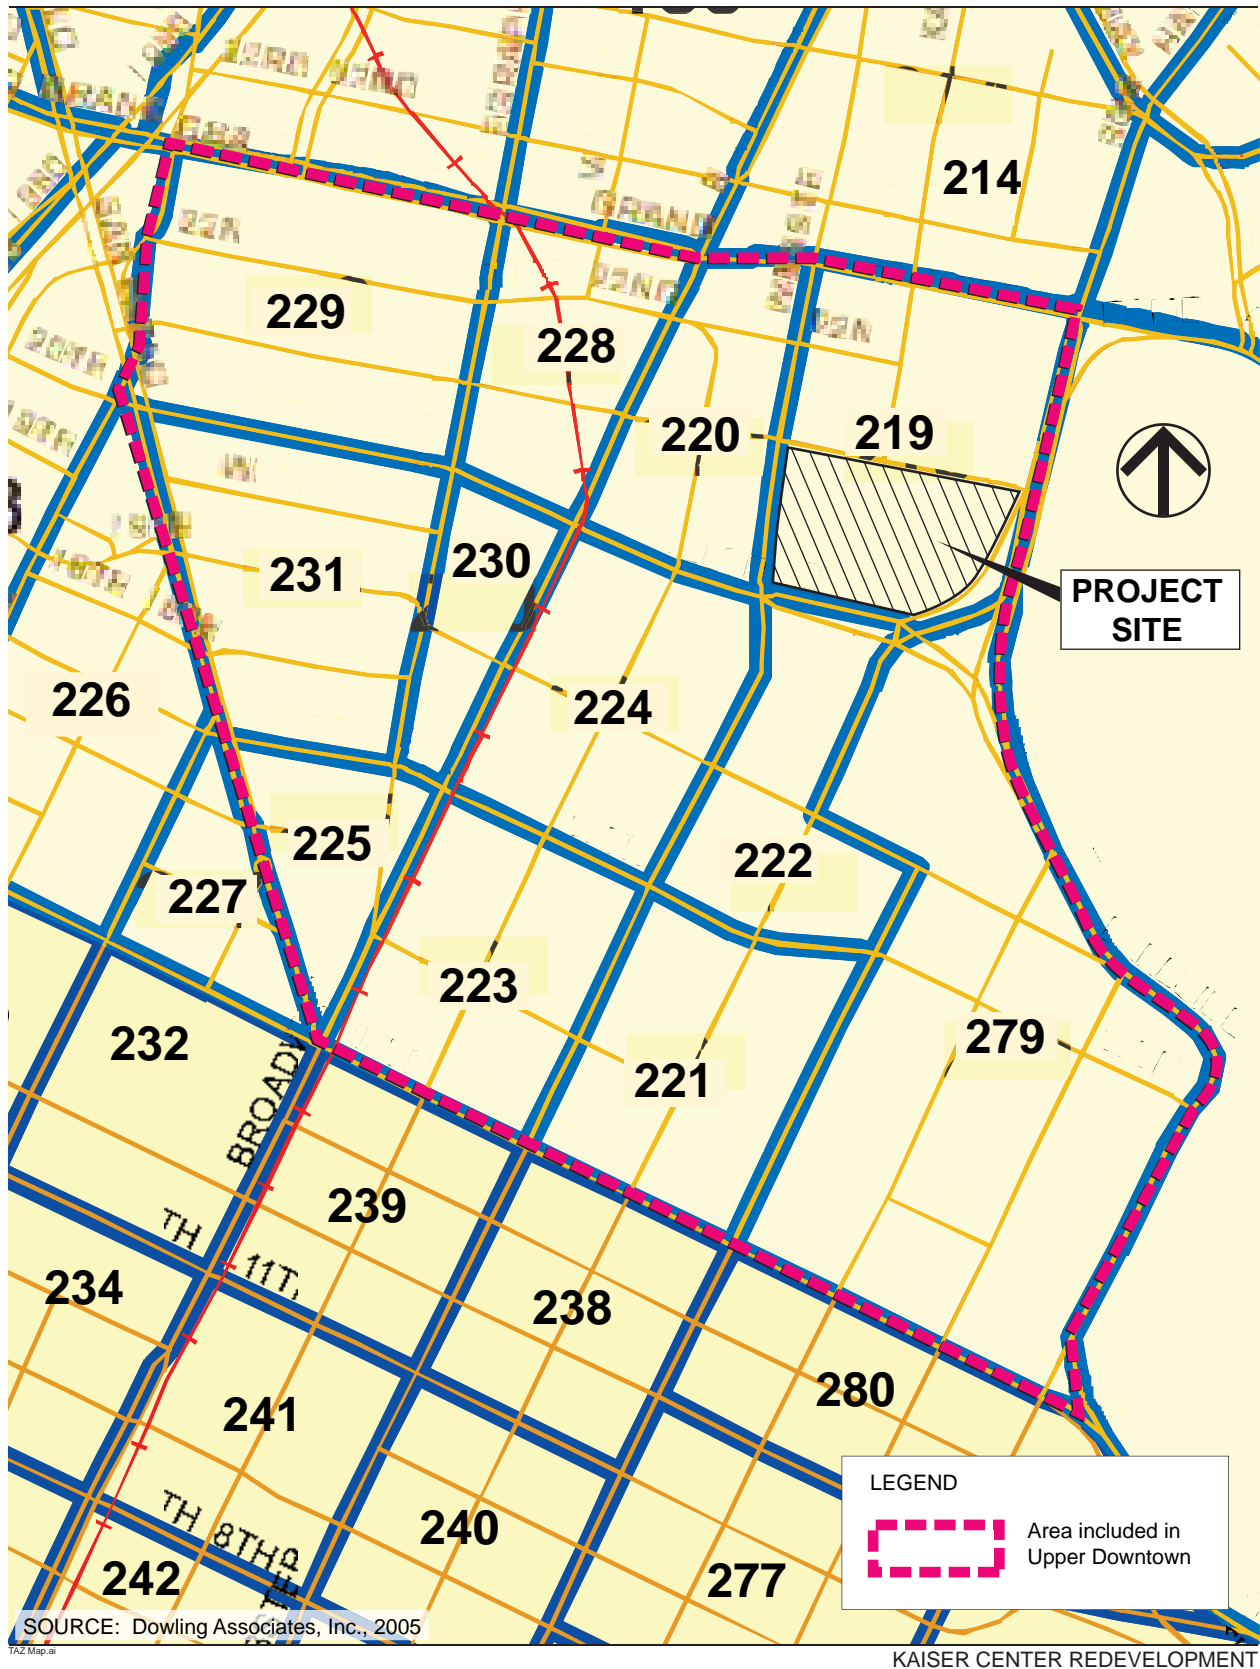

Figure 1
TAZ MAP – UPPER DOWNTOWN OAKLAND

Land Use Adjustments in Project Vicinity

The following two (2) adjustments were made as part of the Project TIA efforts:

- **TAZ 219**, which contains the Project, had its LU information adjusted to remove 190 retail employment and 1,372 service employment to result in zero (0) net growth from Year 2005 to Year 2030 as part of the TIA, as the TIA adopted a methodology to use Institute of Transportation Engineers' (ITE) *Trip Generation Manual, 7th Edition* trip generation rates combined with mode split information contained in the *Mode Split Findings Memorandum* dated October 17, 2008 for Project-generated trips in lieu of ACCMA Model growth projections for solely this Project; and,
- **TAZ 279**, which contains the Emerald Views Condominiums at 222 19th Street, had its LU information adjusted by an additional 370 dwelling units (DU) and three (3) retail employment (equivalent of approximately 933 square feet (SF) café) as part of the TIA.

All other ACCMA Model TAZ LU information were not adjusted as part of the Project TIA efforts.

Table 2 below summarizes the LU information in the TAZ in the Upper Downtown area and the adjustments made to these LU information as part of the Project TIA.

Table 2: ACCMA Model Projections 2005 Land Use Information – Upper Downtown

Land Use Information from Past, Present, Existing, Approved, Pending, and Reasonably Foreseeable Future Developments in Project Vicinity

The following developments are in the Upper Downtown area, and are considered past, present, existing, approved, pending, and reasonably foreseeable future developments as of the Project's Notice of Preparation date on May 22, 2008. The developments and their respective LU information, aggregated by locations of the development by ACCMA Model TAZ, are as follows:

- **TAZ 223** – in the vicinity of east of Broadway between 14th Street and 17th Street, encompasses:
 - 1538 Broadway – 69 DU; and,
 - 1640 Broadway – 254 DU, 177,600 SF office, 4,700 SF retail.
- **TAZ 224** – in the vicinity of east of Broadway between 17th Street and 20th Street, encompasses:
 - 1938 Broadway – 220 DU, 829,500 SF office, 85,200 SF retail.
- **TAZ 229** – in the vicinity of west of Telegraph Avenue between 20th Street and West Grand Avenue, encompasses:
 - 630 Thomas Berkley Square – 88 DU, three (3) commercial spaces.
- **TAZ 231** – in the vicinity of west of Telegraph Avenue between 17th Street and 20th Street, encompasses:
 - Fox Courts – 80 DU, 2,500 SF childcare, art studio;
 - 1755 Broadway – 24 DU;
 - Uptown Development – 665 DU, 14,000 SF retail; and,
 - Uptown Parcel 4 – 370 DU.
- **TAZ 279** – in the vicinity of east of Alice Street between 14th Street and 20th Street, encompasses:
 - Emerald Views Condominiums at 222 19th Street – 370 DU, 933 SF café; and,
 - Jackson Courtyard Condominiums – 45 DU.

Table 3 below summarizes the Upper Downtown area TAZ LU information from all the above mentioned past, present, existing, approved, pending, and reasonably foreseeable future developments against the net growth after adjustments made to the LU information as part of the Project TIA. Note that LU information for TAZ 279 for the Emerald Views Condominiums at 222 19th Street had been adjusted as part of the Project TIA, and thus are not included in the calculation of past, present, existing, approved, pending, and reasonably foreseeable future developments in the Project vicinity. Detailed calculations of LU information by TAZ are presented in the **Appendix** to this memorandum.

Table 3: ACCMA Model Projections 2005 Land Use Information – Upper Downtown

| Land Use Type | Growth
Year 2005 to Year 2030 | | | | |
|--------------------|----------------------------------|---------------------------|--------------------------|---|--------------|

| Wholesale | -6 | n/a | -6 | n/a | -6 |
| Other | 461 | n/a | 461 | n/a | 461 |
| Total | 9,456 | -1,562 | 7,894 | 3,609 | 4,285 |

Source: Alameda County Congestion Management Agency, 2006; Association of Bay Area Governments, 2005; City of Oakland, 2009; AECOM, 2009.

Note: n/a denotes not adjusted.

As shown in **Table 3**, the calculated growth in the ACCMA Model *Projections 2005* LU information from Year 2005 to Year 2030, even after adjustments made to LU information in TAZ 219 and TAZ 279 as part of the Project TIA, overestimates past, present, existing, approved, pending, and reasonably foreseeable future developments by the following amounts in the LU information for the Upper Downtown area – 1,954 DU, 727 retail employment (equivalent of approximately 363,500 SF of retail space), and 2,050 service employment (equivalent of approximately 615,000 SF of office space). These excesses in LU information were accounted for in the projections of the 2030 Cumulative No Project intersections and roadway traffic volumes in the Project TIA, and as such, represent the maximum-probable development scenario for the Upper Downtown area, as contained in the ACCMA Model *Projections 2005* LU information, which is deemed to be consistent within one (1) percent of the ABAG LU *Projections 2005*.

Therefore, it would be most prudent to recommend no further adjustments to the ACCMA Model LU information for the purpose of the Project TIA, and retain the hybrid trip generation methodology of using ITE *Trip Generation Manual, 7th Edition* trip generation rates in conjunction with the mode split and other travel characteristics results as summarized in the *Mode Split Findings Memorandum* dated October 17, 2008 for the purpose of evaluating Project-related trips and their potential impacts.

Intersection Summary

- Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
- # 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
- dl Defacto Left Lane. Recode with 1 though lane as a left lane.

Intersection Summary
 ~ Volume exceeds capacity, queue is theoretically infinite.
 Queue shown is maximum after two cycles.
 # 95th percentile volume exceeds capacity, queue may be longer.
 Queue shown is maximum after two cycles.
 m Volume for 95th percentile queue is metered by upstream signal.

APPENDIX G.10

Supplemental Analysis of Planned Transportation Improvements

Supplementary Analyses of Planned Transportation Improvements

This section summarizes the supplementary analyses of future-year traffic operations at the study intersections and on the study roadway segments assuming the planned AC Transit Bus Rapid Transit (BRT) project and Franklin-Webster bike lanes are completed. The final sections briefly discuss other planned improvements which may affect transportation facilities analyzed as part of this EIR. No supplementary analyses have been conducted for these additional planned improvements, which include the Harrison Street / Oakland Avenue Community Transportation Plan, Broadway Retail Corridor Specific Plan, and I-880 Broadway / Jackson Street Interchange.

It should be noted that none of these improvements are fully funded and approved, and the analysis results presented here only to inform decision makers and the public.

AC Transit East Bay BRT Project

AC Transit has proposed converting the existing 1R-International Rapid into a full BRT service. The 1R currently operates with some BRT features, such as widely-spaced stops at key destinations and transfer points, vehicles designed for easy boarding and alighting, real-time schedules, and transit signal priority. However, AC Transit plans on implementing additional features for the service in the near future, including bus-only median and side-running transitways and stations along the line, completing BRT treatments for a corridor stretching from Berkeley through Downtown Oakland to San Leandro via Telegraph Avenue and International Boulevard.

In the vicinity of the Project, these improvements would generally require the removal of one through lane in each direction along Telegraph Avenue, narrowing the roadway to one vehicular lane in each direction. Buses would run in a protected median, with left turn pockets for autos provided at key intersections. Along Broadway, no travel lanes would be removed and buses would operate in mixed flow. Along 11th and 12th Streets in Downtown Oakland, the BRT service would operate in a side-running configuration, removing one lane of through traffic and eliminating some parking to allow for bulbouts at stations.

Although the BRT is expected to be in service in 2015, the project is only partially funded and not yet approved. As a result, implementation has not been assumed under Near-Term (2015) and Cumulative (2030) analysis scenarios as presented in this Environmental Impact Report (EIR). However, supplementary analysis is provided below for Near-Term (2015) and Cumulative (2030) analysis scenarios assuming the proposed BRT is in service, at study intersections located along the BRT corridor.

It should be noted that the supplementary analysis presented here conservatively assumes the following effects to be negligible:

- Reduction in traffic volumes along the BRT corridor as a result of drivers switching to other parallel corridors due to reduced roadway capacity;

- Reduction in traffic volumes along the BRT corridor and parallel corridors as a result of drivers opting to make trips to other destinations outside of the area or deciding not to make a trip at all; and,
- Reduction in traffic volumes along the BRT corridor as a result of drivers switching to other modes, primarily the new BRT service.

Although the BRT Draft Environmental Impact Statement / Environmental Impact Report (DEIS / DEIR) provide basic screenline volume changes for the BRT corridor and adjacent parallel arterials, the actual volume changes as a result of the BRT are dependent on a multitude of factors including but not limited to roadway and intersection configurations and BRT service characteristics. As a result, the BRT's net effect on trip-making characteristics and driver behavior along the corridor is difficult to estimate at the microscopic level of intersections. In addition, the BRT DEIS / DEIR did not analyze all intersections being analyzed in this EIR.

Given the above considerations, no changes to volumes were assumed after implementation of the BRT. This is a conservative assumption, as it is expected that the BRT would result in decreased volumes along Telegraph Avenue (and a corresponding increase in volumes along most parallel arterials in the corridor).

Intersection Operations

Table 1 summarizes intersection LOS results for Near-Term (2015) without Project Conditions and Near-Term (2015) plus Project (Phase I) Conditions. **Table 2** summarizes intersection LOS results for Near-Term (2015) plus Project (Phase I and II) Conditions. **Table 3** summarizes intersection LOS results for Cumulative (2030) without Project Conditions and Cumulative (2030) plus Project (Phase I and II) Conditions.

Based on the intersection analysis results, the Project would result in significant impacts at Intersection #5 (Telegraph Avenue / 27th Street) under all Project scenarios. Under Near-Term (2015) plus Project (Phase I) Conditions and Near-Term (2015) plus Project (Phase I and II) Conditions, the Project would cause an increase in intersection average delay above the two (2) second threshold. Under Cumulative (2030) plus Project (Phase I and II) Conditions, the Project would cause an increase in v/c ratio above the three (3) percent threshold.

Without the BRT, a Project impact was identified at this intersection for Cumulative (2030) plus Project (Phase I and II) Conditions only; no Project impact was identified under Near-Term (2015) plus Project (Phase I) Conditions or Near-Term (2015) plus Project (Phase I and II) Conditions. As a result, assuming construction and implementation of the BRT, the Project would result in two additional impacts.

Average delay at some intersections would decrease under Project scenarios due to the Project adding traffic to movements which are under capacity (non-critical movements) and underutilizing the green time allotted by the signal, thereby resulting in a higher vehicle throughput and reduced overall intersection average delay.

Roadway Segment Operations

As the BRT would also result in the elimination of one travel lane in each direction along Telegraph Avenue, the roadway analysis results were recalculated for Telegraph Avenue between 20th Street and 27th Street. The results of that analysis are summarized in **Table 4** for Near-Term (2015) without Project Conditions and Near-Term (2015) plus Project (Phase I) Conditions, **Table 5** for Near-Term (2015) plus Project (Phase I and II) Conditions, and **Table 6** for Cumulative (2030) without Project Conditions and Cumulative (2030) plus Project (Phase I and II) Conditions.

Based on the roadway analysis results, the Project would result in a significant impact on Segment #6 (Telegraph Avenue from 20th Street to 27th Street) in the PM peak hour northbound direction under Near-Term (2015) plus Project (Phase I and II) Conditions and in the AM peak hour southbound and PM peak hour northbound directions under Cumulative (2030) plus Project (Phase I and II) Conditions. Under Near-Term (2015) plus Project (Phase I and II) Conditions, the Project causes the segment to degrade from LOS E to LOS F. Under Cumulative (2030) plus Project (Phase I and II) Conditions, the Project causes the segment to degrade from LOS E to LOS F in the AM peak hour causes an increase in v/c ratio above the three (3) percent threshold in the PM peak hour. These would represent new Project impacts, as no impacts were identified on this segment without the BRT.

Franklin / Webster Bikeway Project

Currently in the design stage, the Franklin / Webster Bikeway project would install bike lanes on Franklin Street and Webster Street between Broadway and 14th Street. Installation of the bike lanes would generally require removal of one through lane along both Franklin Street and Webster Street.

Table 7 summarizes intersection LOS results for Near-Term (2015) without Project Conditions and Near-Term (2015) plus Project (Phase I) Conditions. **Table 8** summarizes intersection LOS results for Near-Term (2015) plus Project (Phase I and II) Conditions. **Table 9** summarizes intersection LOS results for Cumulative (2030) without Project Conditions and Cumulative (2030) plus Project (Phase I and II) Conditions.

As shown in **Table 7**, **Table 8**, and **Table 9**, all intersections would operate at acceptable conditions, as there is sufficient capacity on these streets and the Project would not result in any significant impacts.

Average delay at some intersections would decrease under Project scenarios due to the Project adding traffic to movements which are under capacity (non-critical movements) and underutilizing the green time allotted by the signal, thereby resulting in a higher vehicle throughput and reduced overall intersection average delay.

Other Planned Transportation Improvements

In addition to the above improvements for which a separate supplementary analysis was conducted, other transportation improvements in various stages of planning are discussed below.

Harrison Street / Oakland Avenue Community Transportation Plan (CTP)

This planning effort proposes a series of multi-modal improvements to the Harrison Street / Oakland Avenue Corridor. Included are pedestrian improvements (bulbouts, sidewalk, improved crossings), bicycle improvements, and transit improvements (bus bulbouts, bus stop relocations), as well as possible roadway closures and road diets. These improvements could affect study intersections in this EIR located along the corridor, including the following intersections:

- Intersection #1: Harrison Street / Stanley Place / I-580 EB Off-Ramp;
- Intersection #2: Oakland Avenue / Perry Place / I-580 EB Ramps;
- Intersection #3: Harrison Street / 27th Street / 24th Street; and,
- Intersection #12: Harrison Street / Grand Avenue.

Because a finalized design is not yet approved or funded and the Notice of Preparation (NOP) for the CTP was released after the NOP for this EIR, potential effects as a result of the Harrison-Oakland CTP were not assumed under Near-Term (2015) and Cumulative (2030) scenarios. As a result, any mitigation measures proposed at intersections where the CTP is proposing changes may ultimately be deemed in conflict with the goals of the CTP and therefore infeasible.

Broadway Retail Corridor Specific Plan

This planning effort will outline the details for rezoning and redevelopment of the Broadway Auto Row along Broadway between 23rd Street and 29th Street. Currently occupied primarily by car dealerships and surface parking, the plan proposes to transform this stretch of Broadway into a mixed-use corridor with residential units above ground-floor retail uses. The plan would likely result in substantial changes to traffic volumes and circulation, as well as intersection, roadway, pedestrian, and transit facilities in the area. Possible transportation-related improvements being considered are improved pedestrian and bicycle facilities to improve access to transit stops and stations and enhance circulation within the area by non-auto modes. Opportunities to redesign existing transit services or implement new services such as special shuttles will also be considered and the possibility of improvements to bus stops such as shelters, information, and signage will also be evaluated. These improvements could affect the following study intersections in this EIR:

- Intersection #4: Broadway / 27th Street; and,
- Intersection #10: Broadway / Grand Avenue.

Because a finalized plan has not yet approved or funded, potential effects as a result of the Broadway Retail Corridor Specific Plan were not assumed under Near-Term (2015) and Cumulative (2030) scenarios.

I-880 Broadway / Jackson Street Interchange

A Caltrans Project Study Report (PSR) is currently being prepared by the Alameda County Transportation Improvement Authority (ACTIA) and the City of Alameda, improving traffic operations and circulation in the area around the I-880 Broadway / Jackson Street Interchange. Although the project is not yet fully funded, it could include any of the following elements:

- Construction of a new I-880 southbound off-ramp at Martin Luther King, Jr. Way, relieving traffic using the southbound off-ramp at Broadway;
- Reconstruction of the I-880 northbound off-ramp at Broadway to allow vehicles to directly access the Webster Tube ;
- Improvements to the existing Traffic Operations System (TOS) at the Posey / Webster Tubes, I-880, and I-980; and,

- Improvements along 6th Street leading to a new I-880 northbound on-ramp at Market Street.

These elements would affect circulation patterns in the area and could affect the following study intersection in this EIR:

- Intersection #42: Jackson Street / 6th Street / I-880 NB Ramp.

Caltrans have submitted its comments on the Draft PSR to ACTIA, with the final PSR set for completion by late 2009. Since the project is not fully funded nor approved and it is currently unclear how the various improvements would affect operations at study intersections in this EIR located in the vicinity of the interchange, this improvement project was not assumed under Near-Term (2015) and Cumulative (2030) scenarios.

Alternative Freeway Access Route Analysis Memo

AECOM

155 Grand Avenue, Suite 700, Oakland, CA 94612
T 510.763.2929 F 510.834.5220

Memorandum

Date: March 25, 2009

To: Margaret Stanzione, Community and Economic Development Agency,
City of Oakland
Gordon Lum, Transportation Services Division, Community and Economic
Development Agency, City of Oakland

From: Jeffrey Chan, PTP

Subject: Kaiser Center Redevelopment Project Transportation Impact Analysis –
Alternative Freeway Access Route Analysis

This memorandum summarizes the findings from the supplemental analysis considering the effect of high intersection delays on the diversion of Project-generated vehicles to alternative access routes to and from freeways. The analysis considers the following alternative routes:

- To / from I-580 Grand Avenue / Lakeshore Avenue On- and Off-Ramps;
- To SR 13 via Oakland Avenue / Harrison Avenue; and,
- To SB I-880 via the Embarcadero / 10th Avenue On-Ramp.

The following seven “diversion” intersections were selected for analysis:

45. Grand Avenue / El Embarcadero (*signalized*);
46. Lakeshore Avenue / El Embarcadero (*unsignalized*);
47. Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp (*signalized*);
48. Lakeshore Avenue / MacArthur Boulevard (EB) / I-580 EB On-Ramp (*signalized*);
49. Oakland Avenue / MacArthur Boulevard (WB) / Santa Clara Avenue / I-580 WB Off-Ramp (*signalized*);
50. Harrison Street / MacArthur Boulevard (WB) / Santa Clara Avenue (*signalized*); and,
51. Oakland Avenue / Monte Vista Avenue (*unsignalized*).

All intersections are located outside of the Downtown⁽¹⁾ area. The alternative routes and selected study locations are illustrated in **Figure 1**.

⁽¹⁾ Downtown is defined in the Land Use and Transportation Element of the City of Oakland General Plan (page 67) as the area generally bounded by West Grand Avenue to the north, Lake Merritt and Channel Park to the east, the Oakland Estuary to the south and I-980 / Brush Street to the west.

KAISER CENTER TRANSPORTATION STUDY ALTERNATIVE FREEWAY ACCESS ROUTE MEMO

ALTERNATIVE ROUTES

Existing Conditions

Existing Conditions level of service (LOS) at each of the selected study locations is summarized in **Table 1**.

Table 1: Intersection Level of Service – Existing Conditions

| No. | Intersection | Traffic Control ^a | AM Peak Hour | | PM Peak Hour | |
|------------------|--|------------------------------|--------------|--------------------|--------------|--------------------|
| | | | LOS | Delay ^b | LOS | Delay ^b |
| Outside Downtown | | | | | | |
| 45 | Grand Avenue / El Embarcadero | Signal | B | 15.7 | B | 17.4 |
| 46 | Lakeshore Avenue / El Embarcadero | OWSC | F | >50.0 | F | >50.0 |
| 47 | Grand Avenue / MacArthur Blvd. (EB) / I-580 EB Off-Ramp | Signal | D | 40.2 | E | 59.7 |
| 48 | Lakeshore Avenue / MacArthur Blvd. (EB) / I-580 EB On-Ramp | Signal | C | 22.9 | D | 41.6 |
| 49 | Oakland Avenue / MacArthur Blvd. (WB) / Santa Clara Avenue / I-580 WB Off-Ramp | Signal | B | 19.5 | B | 12.9 |
| 50 | Harrison Street / MacArthur Blvd. (WB) / Santa Clara Avenue | Signal | C | 26.9 | B | 16.7 |
| 51 | Oakland Avenue / Monte Vista Avenue | AWSC | B | 11.4 | B | 12.1 |

Bold indicates intersections operating at LOS E or LOS F.

^a AWSC = All-way stop controlled intersection; OWSC = One-way stop controlled intersection

^b The LOS and delay for one-way stop controlled intersections represents the worst movement or approach. The LOS and delay for signalized intersections and all-way stop controlled intersections represent the average delay for all movements.

SOURCE: AECOM, 2009.

As shown in **Table 1**, the following intersections currently operate at LOS E or LOS F:

- Intersection #46: Lakeshore Avenue / El Embarcadero (AM / PM) – LOS F; and,
- Intersection #47: Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp (PM) – LOS E.

Near-Term (2015) Conditions

Near-Term (2015) Conditions LOS at each of the selected study locations is summarized in **Table 2**.

Table 2: Intersection Level of Service – Near-Term (2015) Conditions

| No. | Intersection | Traffic Control ^a | Existing Conditions | | | | Near-Term (2015) Conditions | | | |
|------------------|---|------------------------------|---------------------|--------------------|--------------|--------------------|-----------------------------|--------------------|--------------|--------------------|
| | | | AM Peak Hour | | PM Peak Hour | | AM Peak Hour | | PM Peak Hour | |
| | | | LOS | Delay ^b | LOS | Delay ^b | LOS | Delay ^b | LOS | Delay ^b |

^a AWSC = All-way stop controlled intersection; OWSC = One-way stop controlled intersection

^b The LOS and delay for one-way stop controlled intersections represents the worst movement or approach. The LOS and delay for signalized intersections and all-way stop controlled intersections represent the average delay for all movements.

^c Intersection would be signalized as part of Measure DD.

SOURCE: AECOM, 2009.

As shown in **Table 2**, the following intersections would operate at LOS E or LOS F under Near-Term (2015) Conditions:

- Intersection #45: Grand Avenue / El Embarcadero (PM) – LOS E;
- Intersection #47: Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp (PM) – LOS F; and,
- Intersection #48: Lakeshore Avenue / MacArthur Boulevard (EB) (PM) – LOS F.

LOS at some intersections, such as Lakeshore Avenue / El Embarcadero, would improve in the future, mostly as a result of improvements proposed under Measure DD.

Cumulative (2030) Conditions

Cumulative (2030) Conditions LOS at each of the selected study locations is summarized in **Table 3**.

Table 3: Intersection Level of Service – Cumulative (2030) Conditions

| No. | Intersection | Traffic Control ^a | Existing Conditions | | | | Cumulative (2030) Conditions | | | |
|------------------|---|------------------------------|---------------------|--------------------|--------------|--------------------|------------------------------|--------------------|--------------|--------------------|

| 51 | Oakland Avenue / Monte Vista Avenue | AWSC | B | 11.4 | B | 12.1 | C | 18.7 | E | 48.8 |

Bold indicates intersections operating at LOS E or LOS F.

^a AWSC = All-way stop controlled intersection; OWSC = One-way stop controlled intersection

^b The LOS and delay for one-way stop controlled intersections represents the worst movement or approach. The LOS and delay for signalized intersections and all-way stop controlled intersections represent the average delay for all movements.

^c Intersection would be signalized as part of Measure DD.

SOURCE: AECOM, 2009.

As shown in **Table 3**, the following intersections would operate at LOS E or LOS F under Cumulative (2030) Conditions:

- Intersection #45: Grand Avenue / El Embarcadero (PM) – LOS E;
- Intersection #47: Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp (PM) – LOS F; and,
- Intersection #48: Lakeshore Avenue / MacArthur Boulevard (EB) (PM) – LOS F.

LOS at some intersections, such as Lakeshore Avenue / El Embarcadero, would improve in the future, mostly as a result of improvements proposed under Measure DD.

Existing plus Project (Phase I and Phase II) Conditions

Existing plus Project (Phase I and Phase II) Conditions LOS at each of the selected study locations is summarized in **Table 4**.

Table 4: Intersection Level of Service – Existing plus Project Conditions

| | | | | | | | Existing plus Project (Phase I and Phase II) Conditions | | | |

| 51 | Oakland Avenue / Monte Vista Avenue | AWSC | B | 11.4 | B | 12.1 | B | 12.4 | B | 14.8 |

Bold indicates intersections operating at LOS E or LOS F.

^a AWSC = All-way stop controlled intersection; OWSC = One-way stop controlled intersection

^b The LOS and delay for one-way stop controlled intersections represents the worst movement or approach. The LOS and delay for signalized intersections and all-way stop controlled intersections represent the average delay for all movements.

SOURCE: AECOM, 2009.

As shown in **Table 4**, the following intersections would operate at LOS E or LOS F under Existing plus Project (Phase I and Phase II) Conditions:

- Intersection #46: Lakeshore Avenue / El Embarcadero (AM / PM) – LOS F; and,
- Intersection #47: Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp (PM) – LOS E.

The Project's impacts at each of the above intersections are discussed below:

- Intersection #46: Lakeshore Avenue / El Embarcadero (AM / PM)
The intersection of Lakeshore Avenue / El Embarcadero would operate at LOS F in both the AM and PM peak hours under both Existing plus Project Conditions and Existing plus Project (Phase I and Phase II) Conditions. The intersection is located outside the Downtown area.

The intersection satisfies California MUTCD peak hour traffic signal warrants under Existing plus Project (Phase I and Phase II) Conditions for both the AM and PM peak hours. However, the intersection satisfies peak hour traffic signal warrants even under Existing Conditions without the Project.

It should also be noted that this intersection would be signalized under Measure DD and would operate at acceptable conditions under Near-Term (2015) Conditions and Cumulative (2030) Conditions. Given these considerations, the Project impacts at this intersection are considered less than significant.

Mitigation: None required.

• **Intersection #47: Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp (PM)**

The intersection of Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp would operate at LOS E in the PM peak hour during both Existing Conditions and Existing plus Project (Phase I and Phase II) Conditions.

Since the Project would cause an increase in average intersection delay of 17.0 seconds, which is greater than the four (4) second threshold of significance, and cause an increase in average delay on the critical northbound right movement greater than the six (6) second threshold of significance, the Project would potentially result in a significant impact at this intersection.

Mitigation: The Applicant, Owners, or Successors-in-Interest of the Project shall reconstruct and restripe the right-turn channel on the northbound Grand Avenue approach to accommodate an additional right turn lane. After implementation of the mitigation measure, the intersection would operate at LOS C in the PM peak hour. During the AM peak hour, the intersection would continue to operate at LOS D.

Significance after Implementation of Mitigation: Less than significant.

The 95th percentile queues at LOS E or LOS F intersections under Existing plus Project (Phase I and Phase II) Conditions as shown in **Table 4**, are summarized in **Table 5**. In all cases, the storage capacity is taken as the distance to the nearest intersection, major driveway, or pedestrian crossing.

Table 5: 95th Percentile Queues – Existing plus Project (Phase I and Phase II) Conditions

| No. | Intersection | Lane Group | Existing Conditions | | | Existing plus Project (Phase I and Phase II) Conditions | | |
|-----|---|------------|---------------------|-------------------|--------------|---|-------------------|------------------|
| | | | Storage Cap. (ft) | Queue Length (ft) | | Storage Cap. (ft) | Queue Length (ft) | |
| | | | | AM Peak Hour | PM Peak Hour | | AM Peak Hour | PM Peak Hour |
| 46 | Lakeshore Avenue / El Embarcadero | EB L | 275 | 207 | 521 | 275 | 451 | >1,000 |
| | | EB R | 275 | 51 | 305 | 275 | 51 | 305 |
| 47 | Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp | NE T | 350 | -- | 374 | 350 | -- | 374 |
| | | NE R | 200 | -- | 621 | 200 | -- | 720 |
| | | SW L | 175 | -- | 283 | 175 | -- | 283 |
| | | SW T | 425 | -- | 162 | 425 | -- | 175 |
| | | SE LTR | 375 | -- | 306 | 375 | -- | 306 |
| | | | | | | | | |

Bold indicates exceedance of storage capacity.

SOURCE: AECOM, 2009.

As shown in **Table 5**, the 95th percentile queues in the following lane groups at LOS E or LOS F locations under Existing plus Project (Phase I and Phase II) Conditions would exceed the available storage capacity:

- Intersection #46: Lakeshore Avenue / El Embarcadero (AM / PM) – EBL; and,
- Intersection #47: Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp (AM / PM) – NET (AM / PM), NER (PM), SWL (AM / PM).

It should be noted, however, that in general, the 95th percentile queues at the above locations already exceed the available storage capacity under Existing Conditions. At the following locations where 95th percentile queues exceed storage capacity under Existing plus Project (Phase I and Phase II) Conditions, the Project would cause an increase of 25 feet or greater in 95th percentile queues:

- Intersection #46: Lakeshore Avenue / El Embarcadero (AM / PM) – EBL
In the EBL lane group, the Project would cause an increase in 95th percentile queue length of 244 feet in the AM peak hour. In the PM peak hour, the queue length is infinitely long. Since the Project would cause an increase in 95th percentile queue length greater than 25 feet, the Project would potentially result in a significant impact at this intersection.

As noted in the intersection impact discussion, the intersection would already meet signal warrants under Existing Conditions and is planned for improvements under Measure DD including signalization. After signalization, the 95th percentile queues on the EBL lane group would no longer exceed the storage capacity under Existing plus Project (Phase I and Phase II) Conditions.

Mitigation: None required.

- Intersection #47: Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp (PM) – NER
In the NER lane group, the Project would cause an increase in 95th percentile queue length of 99 feet in the PM peak hour. Since the Project would cause an increase in 95th percentile queue length greater than 25 feet, the Project would potentially result in a significant impact at this intersection.

Mitigation: After implementation of the mitigation measure proposed to mitigate intersection LOS impacts, the 95th percentile queues in the NER lane group would no longer exceed the storage capacity under Existing plus Project (Phase I and Phase II) Conditions.

Significance after Implementation of Mitigation: Less than significant.

Near-Term (2015) plus Project (Phase I) Conditions

Near-Term (2015) plus Project (Phase I) Conditions LOS at each of the selected study locations is summarized in **Table 6**.

As shown in **Table 6**, the following intersections would operate at LOS E or LOS F under Near-Term (2015) plus Project (Phase I) Conditions:

- Intersection #45: Grand Avenue / El Embarcadero (PM) – LOS F;
- Intersection #47: Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp (PM) – LOS E; and,
- Intersection #48: Lakeshore Avenue / MacArthur Boulevard (EB) / I-580 EB On-Ramp (PM) – LOS F.

Table 6: Intersection Level of Service – Near-Term (2015) plus Project (Phase I) Conditions

| | | | Near-Term (2015) Conditions | | | | Near-Term (2015) plus Project (Phase I) Conditions | | | |

| 51 | Oakland Avenue / Monte Vista Avenue | AWSC | B | 13.9 | C | 20.2 | B | 14.7 | C | 23.8 |

Bold indicates intersections operating at LOS E or LOS F.

^a AWSC = All-way stop controlled intersection; OWSC = One-way stop controlled intersection

^b The LOS and delay for one-way stop controlled intersections represents the worst movement or approach. The LOS and delay for signalized intersections and all-way stop controlled intersections represent the average delay for all movements.

^c Intersection would be signalized as part of Measure DD.

SOURCE: AECOM, 2009.

The Project's impacts at each of the above intersections are discussed below:

- **Intersection #45: Grand Avenue / El Embarcadero (PM)**

The intersection of Grand Avenue / El Embarcadero would operate at LOS F in the PM peak hour under Near-Term (2015) plus Project (Phase I) Conditions. The intersection would operate at LOS E in the PM peak hour under Near-Term (2015) Conditions. The intersection is located outside the Downtown area.

Because the Project would cause the intersection to degrade from LOS E to LOS F, the Project would potentially contribute to a significant near-term impact at this intersection. It should be noted, however, that this intersection would undergo geometric changes as part of Measure DD and would already operate at LOS E with 77.7 seconds of average intersection delay under Near-Term (2015) Conditions as a direct result of these changes. The highest delays would be on the northeast Grand Avenue approach, which would have a limited amount of green time available due to the protected left-turn phase on the southwest Grand Avenue approach and the split northwest El Embarcadero approach. While the Project would add traffic to this approach, the poor operation of this approach is directly a result of the Measure DD changes to this intersection. Therefore, the Project's impacts at this intersection are considered less than significant.

Given that there is approximately 30 feet of right-of-way on the northeast Grand Avenue approach, an additional northeast through lane could be accommodated by restriping the

approach, which would improve operations to LOS C in the PM peak hour. In the AM peak hour, the intersection would continue to operate at LOS C.

Mitigation: None required.

- Intersection #47: Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp (PM)
The intersection of Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp would operate at LOS F in the PM peak hour under both Near-Term (2015) Conditions and Near-Term (2015) plus Project (Phase I) Conditions. The intersection is located outside the Downtown area.

Because delay values over 80.0 seconds tend to increase exponentially and are thus generally considered unreliable, the increase in v/c ratio as a result of Project traffic was instead evaluated. The intersection would operate with a v/c ratio of 1.20 under Near-Term (2015) Conditions and 1.23 under Near-Term (2015) plus Project (Phase I) Conditions in the PM peak hour. Since the maximum increase in v/c ratio would be three (3) percent, which is not above the three (3) percent threshold of significance, the Project would not potentially contribute to a significant near-term impact at this intersection.

Mitigation: None required.

- Intersection #48: Lakeshore Avenue / MacArthur Boulevard / I-580 EB On-Ramp (EB) (PM)
The intersection of Lakeshore Avenue / MacArthur Boulevard (EB) / I-580 EB On-Ramp would operate at LOS F in the PM peak hour under both Near-Term (2015) Conditions and Near-Term (2015) plus Project (Phase I) Conditions. The intersection is located outside the Downtown area.

Because delay values over 80.0 seconds tend to increase exponentially and are thus generally considered unreliable, the increase in v/c ratio as a result of Project traffic was instead evaluated. The intersection would operate with a v/c ratio of 1.11 under Near-Term (2015) Conditions and 1.13 under Near-Term (2015) plus Project (Phase I) Conditions in the PM peak hour. Since the maximum increase in v/c ratio would be two (2) percent, which is below the three (3) percent threshold of significance, the Project would not potentially contribute to a significant near-term impact at this intersection.

Mitigation: None required.

The 95th percentile queues at LOS E or LOS F intersections under Near-Term (2015) plus Project (Phase I) Conditions as shown in **Table 6**, are summarized in **Table 7**.

Table 7: 95th Percentile Queues – Near-Term (2015) plus Project (Phase I) Conditions

| No. | Intersection | Lane Group | Near-Term (2015) Conditions | | | Near-Term (2015) plus Project (Phase I) Conditions | | |

| | | T | 425 | -- | 242 | 425 | -- | 250 |
| | | SE LTR | 375 | -- | 553 | 375 | -- | 553 |
| 48 | Lakeshore Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp | NE TR | 250 | -- | 296 | 250 | -- | 309 |
| | | SW L | 150 | -- | 473 | 150 | -- | 473 |
| | | T | 150 | -- | 48 | 150 | -- | 48 |
| | | L | 475 | -- | 126 | 475 | -- | 126 |
| | | EB T | 475 | -- | 487 | 475 | -- | 487 |
| | | R | 475 | -- | 354 | 475 | -- | 363 |

Bold indicates exceedance of storage capacity.

^a Volume for 95th percentile queue is metered by upstream signal.

SOURCE: AECOM, 2009.

As shown in **Table 7**, the 95th percentile queues in the following lane groups at LOS E or LOS F locations under Near-Term (2015) plus Project (Phase I) Conditions would exceed the available storage capacity:

- Intersection #45: Grand Avenue / El Embarcadero (PM) – NETR;
- Intersection #46: Lakeshore Avenue / El Embarcadero (PM) – NER, SWL, and SELTR; and,
- Intersection #48: Lakeshore Avenue / MacArthur Boulevard (EB) / I-580 EB On-Ramp (PM) – NETR, SWL, and EBT.

It should be noted, however, that the 95th percentile queues at the above locations already exceed the available storage capacity under Near-Term (2015) Conditions. At the following location where 95th percentile queues exceed storage capacity under Near-Term (2015) plus Project (Phase I) Conditions, the Project would cause an increase of 25 feet or greater in 95th percentile queues:

- Intersection #45: Grand Avenue / El Embarcadero (PM) – NETR
In the NETR lane group, the Project would cause an increase in 95th percentile queue length of 41 feet in the PM peak hour. On the SWL and SWT lane groups, queues are short because the arrival of vehicles at the approach is controlled by the traffic signal at the upstream intersection. Since the Project would cause an increase in 95th percentile queue length greater than 25 feet, the Project would potentially result in a significant impact at this intersection.

As noted in the intersection impact discussion, this intersection would undergo geometric changes as part of Measure DD. The 95th percentile queue length on the NETR lane group would already exceed the storage capacity under Near-Term (2015) Conditions as a direct result of these changes. Therefore, the Project's impacts at this intersection are considered less than significant.

If the northeast Grand Avenue approach were restriped to accommodate an additional through lane, the 95th percentile queues in the PM peak hour would be reduced to 596 feet, which would no longer exceed the storage capacity.

Mitigation: None required.

Near-Term (2015) plus Project (Phase I and Phase II) Conditions

Near-Term (2015) plus Project (Phase I and Phase II) Conditions LOS at each of the selected study locations is summarized in **Table 8**.

Table 8: Intersection Level of Service – Near-Term (2015) plus Project (Phase I and Phase II) Conditions

| No. | Intersection | Traffic Control ^a | Near-Term (2015) Conditions | | | | Near-Term (2015) plus Project (Phase I and Phase II) Conditions | | | |
|------------------|---|------------------------------|-----------------------------|--------------------|--------------|--------------------|---|--------------------|--------------|--------------------|
| | | | AM Peak Hour | | PM Peak Hour | | AM Peak Hour | | PM Peak Hour | |
| | | | LOS | Delay ^b | LOS | Delay ^b | LOS | Delay ^b | LOS | Delay ^b |
| Outside Downtown | | | | | | | | | | |
| 45 | Grand Avenue / El Embarcadero | Signal | C | 24.5 | E | 77.7 | C | 25.5 | F | >80.0 |
| 46 | Lakeshore Avenue / El Embarcadero | Signal ^c | B | 16.3 | B | 15.2 | B | 16.4 | B | 17.0 |
| 47 | Grand Avenue / MacArthur Blvd. (EB) | Signal | D | 37.6 | F | >80.0 | D | 37.3 | F | >80.0 |
| 48 | Lakeshore Avenue / MacArthur Blvd. (EB) | Signal | C | 27.1 | F | >80.0 | C | 27.2 | F | >80.0 |
| 49 | Oakland Avenue / MacArthur Blvd. (WB) | Signal | C | 23.2 | B | 15.1 | C | 27.8 | B | 15.8 |
| 50 | Harrison Street / MacArthur Blvd. (WB) | Signal | D | 46.4 | B | 17.9 | D | 52.0 | B | 18.1 |
| 51 | Oakland Avenue / Monte Vista Avenue | AWSC | B | 13.9 | C | 20.2 | C | 15.9 | D | 30.9 |

Bold indicates intersections operating at LOS E or LOS F.

^a AWSC = All-way stop controlled intersection; OWSC = One-way stop controlled intersection

^b The LOS and delay for one-way stop controlled intersections represents the worst movement or approach. The LOS and delay for signalized intersections and all-way stop controlled intersections represent the average delay for all movements.

^c Intersection would be signalized as part of Measure DD.

SOURCE: AECOM, 2009.

As shown in **Table 8**, the following intersections would operate at LOS E or LOS F under Near-Term (2015) plus Project (Phase I and Phase II) Conditions:

- Intersection #45: Grand Avenue / El Embarcadero (PM) – LOS F;

- Intersection #47: Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp (PM) – LOS E; and,
- Intersection #48: Lakeshore Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp (PM) – LOS F.

The Project's impacts at each of the above intersections are discussed below:

- Intersection #45: Grand Avenue / El Embarcadero (PM)
The intersection of Grand Avenue / El Embarcadero would operate at LOS F in the PM peak hour under Near-Term (2015) plus Project (Phase I and Phase II) Conditions. The intersection would operate at LOS E in the PM peak hour under Near-Term (2015) Conditions. The intersection is located outside the Downtown area.

Because the Project would cause the intersection to degrade from LOS E to LOS F, the Project would potentially contribute to a significant near-term impact at this intersection. It should be noted, however, that this intersection would undergo geometric changes as part of Measure DD and would already operate at LOS E with 77.7 seconds of average intersection delay under Near-Term (2015) Conditions as a direct result of these changes. The highest delays would be on the northeast Grand Avenue approach, which would have a limited amount of green time available due to the protected left-turn phase on the southwest Grand Avenue approach and the split northwest El Embarcadero approach. While the Project would add traffic to this approach, the poor operation of this approach is directly a result of the Measure DD changes to this intersection. Therefore, the Project's impacts at this intersection are considered less than significant.

Given that there is approximately 30 feet of right-of-way on the northeast Grand Avenue approach, an additional northeast through lane could be accommodated by restriping the approach, which would improve operations to LOS C in the PM peak hour. In the AM peak hour, the intersection would continue to operate at LOS C.

Mitigation: None required.

- Intersection #47: Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp (PM)
The intersection of Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp would operate at LOS F in the PM peak hour under both Near-Term (2015) Conditions and Near-Term (2015) plus Project (Phase I) Conditions. The intersection is located outside the Downtown area.

Because delay values over 80.0 seconds tend to increase exponentially and are thus generally considered unreliable, the increase in v/c ratio as a result of Project traffic was instead evaluated. The intersection would operate with a v/c ratio of 1.20 under Near-Term (2015) Conditions and 1.26 under Near-Term (2015) plus Project (Phase I) Conditions in the PM peak hour. Since the maximum increase in v/c ratio would be six (6) percent, which is above the three (3) percent threshold of significance, the Project would potentially contribute to a significant near-term impact at this intersection.

Mitigation: As proposed under Existing plus Project (Phase I and Phase II) Conditions, the Applicant, Owners, or Successors-in-Interest of the Project shall reconstruct and restripe the right-turn channel on the northbound Grand Avenue approach to accommodate an additional right turn lane. After implementation of the mitigation measure, the intersection would still operate at LOS E in the PM peak hour, but the Project's impacts at this intersection would be mitigated. During the AM peak hour, the intersection would continue to operate at LOS D.

Significance after Implementation of Mitigation: Less than significant.

- Intersection #48: Lakeshore Avenue / MacArthur Boulevard / I-580 EB On-Ramp (EB) (PM)
The intersection of Lakeshore Avenue / MacArthur Boulevard (EB) / I-580 EB On-Ramp would operate at LOS F in the PM peak hour under both Near-Term (2015) Conditions and Near-Term (2015) plus Project (Phase I) Conditions. The intersection is located outside the Downtown area.

Because delay values over 80.0 seconds tend to increase exponentially and are thus generally considered unreliable, the increase in v/c ratio as a result of Project traffic was instead evaluated. The intersection would operate with a v/c ratio of 1.11 under Near-Term (2015) Conditions and 1.15 under Near-Term (2015) plus Project (Phase I) Conditions in the PM peak hour. Since the maximum increase in v/c ratio would be four (4) percent, which is above the three (3) percent threshold of significance, the Project would potentially contribute to a significant near-term impact at this intersection.

Mitigation: The Applicant, Owners, or Successors-in-Interest of the Project shall retime the signal at this intersection, increasing green time to the critical southbound left-turn movement from Lakeshore Avenue and eastbound through movement from MacArthur Boulevard. After implementation of the mitigation measure, the intersection would still operate at LOS E in the PM peak hour, but the Project's impacts at this intersection would be mitigated.

Significance after Implementation of Mitigation: Less than significant.

The 95th percentile queues at LOS E or LOS F intersections under Near-Term (2015) plus Project (Phase I) Conditions as shown in **Table 8**, are summarized in **Table 9**.

As shown in **Table 9**, the 95th percentile queues in the following lane groups at LOS E or LOS F locations under Near-Term (2015) plus Project (Phase I and Phase II) Conditions would exceed the available storage capacity:

- Intersection #45: Grand Avenue / El Embarcadero (PM) – NETR;
- Intersection #46: Lakeshore Avenue / El Embarcadero (PM) – NER, SWL, and SELTR; and,
- Intersection #48: Lakeshore Avenue / MacArthur Boulevard (EB) / I-580 EB On-Ramp (PM) – NETR, SWL, and EBT.

It should be noted, however, that the 95th percentile queues at the above locations already exceed the available storage capacity under Near-Term (2015) Conditions. At the following location where 95th percentile queues exceed storage capacity under Near-Term (2015) plus Project (Phase I) Conditions, the Project would cause an increase of 25 feet or greater in 95th percentile queues:

- Intersection #45: Grand Avenue / El Embarcadero (PM) – NETR
In the NETR lane group, the Project would cause an increase in 95th percentile queue length of 41 feet in the PM peak hour. Since the Project would cause an increase in 95th percentile queue length greater than 25 feet, the Project would potentially result in a significant impact at this intersection.

As noted in the intersection impact discussion, this intersection would undergo geometric changes as part of Measure DD. The 95th percentile queue length on the NETR lane group would already exceed the storage capacity under Near-Term (2015) Conditions as a direct result of these changes. Therefore, the Project's impacts at this intersection are considered less than significant.

Table 9: 95th Percentile Queues – Near-Term (2015) plus Project (Phase I and Phase II) Conditions

| No. | Intersection | Lane Group | Near-Term (2015) Conditions | | | Near-Term (2015) plus Project
(Phase I and Phase II) Conditions | | |

| | | R | 475 | -- | 354 | 475 | -- | 364 |

Bold indicates exceedance of storage capacity.^a Volume for 95th percentile queue is metered by upstream signal.

SOURCE: AECOM, 2009.

If the northeast Grand Avenue approach were restriped to accommodate an additional through lane, the 95th percentile queues in the PM peak hour would be reduced to 632 feet, which would still exceed the storage capacity, but mitigate the Project's impacts at this intersection

Mitigation: None required.**Cumulative (2030) plus Project (Phase I and Phase II) Conditions**

Cumulative (2030) plus Project (Phase I and Phase II) Conditions LOS at each of the selected study locations is summarized in **Table 10**.

^a AWSC = All-way stop controlled intersection; OWSC = One-way stop controlled intersection

^b The LOS and delay for one-way stop controlled intersections represents the worst movement or approach. The LOS and delay for signalized intersections and all-way stop controlled intersections represent the average delay for all movements.

^c Intersection would be signalized as part of Measure DD.

SOURCE: AECOM, 2009.

As shown in **Table 10**, the following intersections would operate at LOS E or LOS F under Cumulative (2030) plus Project (Phase I and Phase II) Conditions:

- Intersection #45: Grand Avenue / El Embarcadero (PM) – LOS F;
- Intersection #47: Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp (PM) – LOS F;
- Intersection #48: Lakeshore Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp (PM) – LOS F;
- Intersection #49: Oakland Avenue / MacArthur Boulevard (WB) / Santa Clara Avenue / I-580 WB Off-Ramp (AM) – LOS E;
- Intersection #50: Harrison Street / MacArthur Boulevard (WB) / Santa Clara Avenue (AM) – LOS F; and,
- Intersection #51: Oakland Avenue / Monte Vista Avenue (PM) – LOS F.

The Project's impacts at each of the above intersections are discussed below:

- Intersection #45: Grand Avenue / El Embarcadero (PM)
The intersection of Grand Avenue / El Embarcadero would operate at LOS F in the PM peak hour under both Cumulative (2030) Conditions and Cumulative (2030) plus Project (Phase I and Phase II) Conditions. The intersection is located outside the Downtown area.

Because delay values over 80.0 seconds tend to increase exponentially and are thus generally considered unreliable, the increase in v/c ratio as a result of Project traffic was instead evaluated. The intersection would operate with a v/c ratio of 1.01 under Cumulative (2030) Conditions and 1.06 under Cumulative (2030) plus Project (Phase I) Conditions in the PM peak hour. Since the maximum increase in v/c ratio would be five (5) percent, which is above the three (3) percent threshold of significance, the Project would potentially contribute to a significant near-term impact at this intersection.

It should be noted, however, that this intersection would undergo geometric changes as part of Measure DD and would already operate at LOS F with greater than 80.0 seconds of average intersection delay under Cumulative (2030) Conditions as a direct result of these changes. The highest delays would be on the northeast Grand Avenue approach, which would have a limited amount of green time available due to the protected left-turn phase on the southwest Grand Avenue approach and the split northwest El Embarcadero approach. While the Project would add traffic to this approach, the poor operation of this approach is directly a result of the Measure DD changes to this intersection. Therefore, the Project's impacts at this intersection are considered less than significant.

Given that there is approximately 30 feet of right-of-way on the northeast Grand Avenue approach, an additional northeast through lane could be accommodated by restriping the approach, which would improve operations to LOS C in the PM peak hour. In the AM peak hour, the intersection would continue to operate at LOS C.

Mitigation: None required.

- Intersection #47: Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp (PM)
The intersection of Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp would operate at LOS F in the PM peak hour under both Cumulative (2030) Conditions and Cumulative (2030) plus Project (Phase I and Phase II) Conditions. The intersection is located outside the Downtown area.

Because delay values over 80.0 seconds tend to increase exponentially and are thus generally considered unreliable, the increase in v/c ratio as a result of Project traffic was instead evaluated. The intersection would operate with a v/c ratio of 1.61 under Cumulative (2030) Conditions and 1.66 under Cumulative (2030) plus Project (Phase I and Phase II) Conditions in the PM peak hour. Since the maximum increase in v/c ratio would be five (5) percent, which is above the three (3) percent threshold of significance, the Project would potentially contribute to a significant near-term impact at this intersection.

Mitigation: As proposed under Existing plus Project (Phase I and Phase II) Conditions and Near-Term (2015) plus Project (Phase I and Phase II) Conditions, the Applicant, Owners, or Successors-in-Interest of the Project shall reconstruct and restripe the right-turn channel on the northbound Grand Avenue approach to accommodate an additional right turn lane. In addition, they shall restripe the eastbound MacArthur Boulevard / I-580 EB Off-Ramp approach to accommodate an additional through lane. After implementation of the mitigation measure, the intersection would still operate at LOS F in the PM peak hour, but the Project's impacts at this intersection would be mitigated. During the AM peak hour, the intersection would continue to operate at LOS C.

Significance after Implementation of Mitigation: Less than significant.

- Intersection #48: Lakeshore Avenue / MacArthur Boulevard / I-580 EB On-Ramp (EB) (PM)
The intersection of Lakeshore Avenue / MacArthur Boulevard (EB) / I-580 EB On-Ramp would operate at LOS F in the PM peak hour under both Cumulative (2030) Conditions and Cumulative (2030) plus Project (Phase I and Phase II) Conditions. The intersection is located outside the Downtown area.

Because delay values over 80.0 seconds tend to increase exponentially and are thus generally considered unreliable, the increase in v/c ratio as a result of Project traffic was instead evaluated. The intersection would operate with a v/c ratio of 1.32 under Near-Term (2015) Conditions and 1.37 under Near-Term (2015) plus Project (Phase I) Conditions in the PM peak hour. Since the maximum increase in v/c ratio would be five (5) percent, which is above the three (3) percent threshold of significance, the Project would potentially contribute to a significant near-term impact at this intersection.

Mitigation: The Applicant, Owners, or Successors-in-Interest of the Project shall redesign the I-580 EB On-Ramp with an additional lane and restripe the approaches at this intersection as follows:

- The southbound Lakeshore Avenue approach would be restriped from the existing configuration of one exclusive left-turn lane and two through lanes to two exclusive left-turn lanes and one through lane; and,
- The median on the northeast Lakeshore Avenue approach would be narrowed and restriped from the existing configuration of one through lane and one shared through-right lane to one through lane and two exclusive right-turn lanes.

After implementation of the mitigation measure, the intersection would still operate at LOS F in the PM peak hour, but the Project's impacts at this intersection would be mitigated. In the AM peak hour, the intersection would operate at LOS C.

Significance after Implementation of Mitigation: Less than significant.

- Intersection #49: Oakland Avenue / MacArthur Boulevard (WB) / Santa Clara Avenue / I-580 WB Off-Ramp (AM)
The intersection of Oakland Avenue / MacArthur Boulevard (WB) / Santa Clara Avenue / I-580 WB Off-Ramp would operate at LOS E in the AM peak hour under Cumulative (2030) plus Project (Phase I and Phase II) Conditions. The intersection would operate at LOS D in the AM peak hour under Cumulative (2030) Conditions. The intersection is located outside the Downtown area.

Because the Project would cause the intersection to degrade from LOS D to LOS E, the Project would potentially contribute to a significant near-term impact at this intersection.

Mitigation: The Applicant, Owners, or Successors-in-Interest of the Project shall retime the signal to increase the green time to the northwest MacArthur Boulevard approach. After implementation of the mitigation measure, the intersection would operate at LOS C.

Significance after Implementation of Mitigation: Less than significant.

- Intersection #50: Harrison Street / MacArthur Boulevard (WB) / Santa Clara Avenue (AM)
The intersection of Harrison Street / MacArthur Boulevard (WB) / Santa Clara Avenue would operate at LOS F in the AM peak hour under Cumulative (2030) plus Project (Phase I and Phase II) Conditions. The intersection would operate at LOS E in the AM peak hour under Cumulative (2030) Conditions. The intersection is located outside the Downtown area.

Because the Project would cause the intersection to degrade from LOS E to LOS F, the Project would potentially contribute to a significant near-term impact at this intersection.

Mitigation: The Applicant, Owners, or Successors-in-Interest of the Project shall restripe the southwest Harrison Street approach to accommodate an additional through lane. After implementation of the mitigation measure, the intersection would operate at LOS D in the AM peak hour and LOS B in the PM peak hour.

Significance after Implementation of Mitigation: Less than significant.

- Intersection #51: Oakland Avenue / Monte Vista Avenue (PM)

The intersection of Oakland Avenue / Monte Vista Avenue would operate at LOS F in the PM peak hour under Cumulative (2030) plus Project (Phase I and Phase II) Conditions. The intersection would operate at LOS E in the PM peak hour under Cumulative (2030) Conditions. The intersection is located outside the Downtown area.

Because the Project would cause the intersection to degrade from LOS E to LOS F, the Project would potentially contribute to a significant near-term impact at this intersection.

Mitigation: The delays at the intersection are primarily on the eastbound Oakland Avenue approach. The Applicant, Owners, or Successors-in-Interest of the Project shall signalize the intersection. After implementation of the mitigation measure, the intersection would operate at LOS B in the PM peak hour. In the AM peak hour, the intersection would operate at LOS B.

Significance after Implementation of Mitigation: Less than significant.

The 95th percentile queues at LOS E or LOS F intersections under Cumulative (2030) plus Project (Phase I) Conditions as shown in **Table 10**, are summarized in **Table 11**.

As shown in **Table 11**, the 95th percentile queues in the following lane groups at LOS E or LOS F locations under Cumulative (2030) plus Project (Phase I and Phase II) Conditions would exceed the available storage capacity:

- Intersection #45: Grand Avenue / El Embarcadero (PM) – NETR;
- Intersection #47: Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp (PM) – NER, SWL, and SELTR;
- Intersection #48: Lakeshore Avenue / MacArthur Boulevard (EB) / I-580 EB On-Ramp (PM) – NETR, SWL, and EBT;
- Intersection #49: Oakland Avenue / MacArthur Boulevard (WB) / Santa Clara Avenue / I-580 WB Off-Ramp (AM) – NWTR and NELT;
- Intersection #50: Harrison Street / MacArthur Boulevard (WB) / Santa Clara Avenue (AM) – NWL, NWT, and SWTR; and,
- Intersection #51: Oakland Avenue / Monte Vista Avenue (PM) – EBTR.

Table 11: 95th Percentile Queues – Cumulative (2030) plus Project (Phase I and Phase II) Conditions

Bold indicates exceedance of storage capacity.^a Volume for 95th percentile queue is metered by upstream signal.^b For all-way stop intersections, queue length represents average queue.

SOURCE: AECOM, 2009.

It should be noted, however, that the 95th percentile queues at the above locations already exceed the available storage capacity under Cumulative (2030) Conditions. At the following location where 95th percentile queues exceed storage capacity under Cumulative (2030) plus Project (Phase I and Phase II) Conditions, the Project would cause an increase of 25 feet or greater in 95th percentile queues:

- Intersection #45: Grand Avenue / El Embarcadero (PM) – NETR

In the NETR lane group, the Project would cause an increase in 95th percentile queue length of 90 feet in the PM peak hour. Since the Project would cause an increase in 95th percentile queue

length greater than 25 feet, the Project would potentially result in a significant impact at this intersection.

As noted in the intersection impact discussion, this intersection would undergo geometric changes as part of Measure DD. The 95th percentile queue length on the NETR lane group would already exceed the storage capacity under Cumulative (2030) Conditions as a direct result of these changes. Therefore, the Project's impacts at this intersection are considered less than significant.

If the northeast Grand Avenue approach were restriped to accommodate an additional through lane, the 95th percentile queues in the PM peak hour would be reduced to 682 feet, which would still exceed the storage capacity, but mitigate the Project's impacts at this intersection

Mitigation: None required.

- Intersection #47: Grand Avenue / MacArthur Boulevard (EB) / I-580 EB Off-Ramp (PM) – NER
In the NER lane group, the Project would cause an increase in 95th percentile queue length of 31 feet in the PM peak hour. Since the Project would cause an increase in 95th percentile queue length greater than 25 feet, the Project would potentially result in a significant impact at this intersection.

Mitigation: After implementation of the mitigation measure proposed to mitigate LOS impacts at this intersection, the 95th percentile queues on the NER lane group under Cumulative (2030) plus Project (Phase I and Phase II) Conditions would be reduced to 330 feet in the PM peak hour, which would no longer exceed the available storage capacity.

Significance after Implementation of Mitigation: Less than significant.

- Intersection #48: Lakeshore Avenue / MacArthur Boulevard (EB) / I-580 EB On-Ramp (PM) – NETR
In the NETR lane group, the Project would cause an increase in 95th percentile queue length of 30 feet in the PM peak hour. Since the Project would cause an increase in 95th percentile queue length greater than 25 feet, the Project would potentially result in a significant impact at this intersection.

Mitigation: After implementation of the mitigation measure proposed to mitigate LOS impacts at this intersection, the 95th percentile queues on the NER lane group under Cumulative (2030) plus Project (Phase I and Phase II) Conditions would still exceed the available storage capacity. Given geometric constraints after implementation of that mitigation measure, it would not be possible to make further changes to lane configuration to mitigate the Project's queuing impacts at this intersection. Therefore, the Project's impacts at this intersection are significant and unavoidable.

Significance after Implementation of Mitigation: Significant and unavoidable.

- Intersection #49: Oakland Avenue / MacArthur Boulevard (WB) / Santa Clara Avenue / I-580 WB Off-Ramp (AM) – NWTR
In the EBTR lane group, the Project would cause an increase in 95th percentile queue length of 195 feet in the PM peak hour. Since the Project would cause an increase in 95th percentile queue length greater than 25 feet, the Project would potentially result in a significant impact at this intersection.

Mitigation: After implementation of the mitigation measure proposed to mitigate LOS impacts at this intersection, the 95th percentile queues on the NER lane group under Cumulative (2030) plus Project (Phase I and Phase II) Conditions would be reduced to 337 feet, which would no longer exceed the available storage capacity.

Significance after Implementation of Mitigation: Less than significant.

- Intersection #51: Oakland Avenue / Monte Vista Avenue (PM) – EBTR

In the EBTR lane group, the Project would cause an increase in 95th percentile queue length of 195 feet in the PM peak hour. Since the Project would cause an increase in the average queue length greater than 25 feet, the Project would potentially result in a significant impact at this intersection.

Mitigation: After implementation of the mitigation measure proposed to mitigate LOS impacts at this intersection, the 95th percentile queues on the NER lane group under Cumulative (2030) plus Project (Phase I and Phase II) Conditions would be 299 feet, which would still exceed the available storage capacity, but mitigate the Project's impacts at this intersection.

For the other lane groups, installation of a signal at this intersection would not result in 95th percentile queues that exceed the available storage capacity in the PM peak hour, except for the EBL lane group, which is currently striped as a 50-foot turn pocket. In the PM peak hour, the 95th percentile queues on the EBL lane group under Cumulative (2030) plus Project (Phase I and Phase II) Conditions would be 112 feet. Therefore, the Applicant, Owners, or Successors-in-Interest of the Project shall restripe the pocket with 125 feet of storage capacity.

Significance after Implementation of Mitigation: Less than significant.

APPENDIX G.12

Harrison Street-Oakland Avenue Study

Harrison-Oakland Avenue Community-Based Transportation Plan (CBTP) Study Comparison

The Harrison-Oakland Avenue Community-Based Transportation Plan (CBTP) Study is a planning effort that proposes a series of multi-modal improvements (bulbouts, sidewalks, improved crossings), bicycle improvements, transit improvements (bus bulbouts, bus stop relocations), as well as possible roadway closures and road diets. . However, the Harrison-Oakland Avenue Study was not included in the DEIR's assumptions of planned transportation network changes. The Harrison-Oakland couplet has not undergone environmental review, has not been approved by the City, is not a funded project, and did not have final designs at the time of preparation of the DEIR. Consistent with City practice, this study was therefore not assumed as part of the planned transportation network changes and was not assumed in the analysis.

However, the City has examined the potential effects of the Kaiser Center Office Project on a street network that would include the Harrison-Oakland couplet scheme. Those results and conclusions are as follows:

The DEIR evaluated seven intersections that were also evaluated in the CBTP Study. These intersections include¹:

1. Harrison Street / Stanley Place / I-580 Eastbound Off-Ramp (*unsignalized*) (CBTP Study #4)
2. Oakland Avenue / Perry Place / I-580 Eastbound Ramps (CBTP Study #5)
3. Harrison Street / 27th Street / 24th Street / Bay Place (CBTP Study #10)
12. Harrison Street / Grand Avenue (within Downtown Oakland) (CBTP Study #11)
49. Oakland Avenue / MacArthur Boulevard (Westbound) / Santa Clara Avenue / I-580 Westbound Off-Ramp (CBTP Study #3)
50. Harrison Street / MacArthur Boulevard (Westbound) / Santa Clara Avenue (CBTP Study #2)
51. Oakland Avenue / Monte Vista Avenue / Vernon Street (*unsignalized*) (CBTP Study #1)

The findings from this DEIR and the CBTP Study are summarized below and in Table 1.

Reasons for Different Findings

There are several reasons that the two studies would have different results:

- This DEIR analyzes future forecasted conditions based on ACCMA Model year 2030. The CBTP Study analyzed future forecasted conditions based on ACCMA Model year 2035.
- The Harrison-Oakland Avenue Study has assumed fundamental shifts in traffic patterns by converting one-directional traffic flow on Harrison Street and Oakland Avenue to two-way traffic flow north of I-580 and reduced travel lane capacity on these streets south of I-580.

¹ Numbers shown (e.g., 1. Harrison Street / Stanley Place / I-580 Eastbound Off-Ramp) identify the location of the intersection on Figure IV.L-2 in Chapter IV.L, Transportation and Circulation, in this DEIR. Numbers of the corresponding intersections in the CBTP Study are shown in parentheses. All intersection on located in Downtown Oakland unless otherwise noted.

- The two studies collected existing traffic data at different times. The existing traffic data is used as the basis for developing the 2030 traffic forecasts. So, using different existing traffic assumptions will result in different forecasts.
- The signal timing parameters between the two studies were different in the 2030 and 2035 scenarios. This EIR analysis held existing signal timing unchanged under future scenarios (as is proper), whereas the Harrison-Oakland corridor study optimized the timing for their future scenarios. The technical analyst doing the intersection analyses must make determinations regarding several signal timing parameters such as green time allocation to each traffic movement. These parameters are different between the two studies but both are within standard engineering practice.

However, even with these differences the intersection analysis results are similar, indicating that conclusions drawn from the CBTP Study would also be applicable to this DEIR analysis.

Summary of Findings

#1. Harrison Street / Stanley Place / I-580 Eastbound Off-Ramp (*unsignalized*) (CBTP Intersection #4)

The CBTP Study recommended changes at this intersection to include realigning the off-I-580 Off-Ramp as a “hard” right-turn onto Harrison Street, signalization, and addition of a travel lane along the off-ramp. Southbound Harrison Street would be modified from three travel lanes to two travel lanes and a bike lane, with a new crosswalk across the north leg of the intersection. The Stanley Place approach at the intersection would be closed off, with bollards providing fire truck access in case of emergency.

This DEIR identifies that Project-generated traffic, when added to other cumulative traffic by year 2030, would not adversely impact this intersection. Although the side-street service level at this unsignalized intersection would operate at LOS F during the AM peak hour, the intersection would not satisfy the California MUTCD peak-hour signal warrant. As a result, no mitigation measures were explored for this intersection.

The LOS results presented in the CBTP Study are not directly comparable to those presented in this DEIR because the CBTP Study assumes major changes which would substantially improve the operations of this intersection, including the following items:

- **Signalization of the intersection.** Signalizing the intersection would provide a dedicated gap in southbound Harrison Street traffic, improving off-ramp serviceability.
- **Additional off-ramp lane.** The additional off-ramp lane would increase vehicle storage capacity and off-ramp serviceability.
- **Stanley Place closure.** The closure of Stanley Place would eliminate conflicts with off-ramp traffic,

As a result, the LOS presented in the CBTP is substantially better than for the DEIR, as shown in **Table 1**.

#2. Oakland Avenue / Perry Place / I-580 Eastbound Ramps (CBTP Study Intersection #5)

The CBTP Study recommended changes at this intersection to include reducing the one-directional northbound travel lanes on Oakland Avenue from three lanes to two lanes by converting a current through lane to a right-turn only lane. Other recommended improvements include construction of a new pedestrian staircase connecting Harrison Street to Oakland Avenue and a new pedestrian refuge island on Perry Place. The Study also recommended increasing the signal cycle length at this intersection from 80 seconds to 120 seconds, which would improve the delay time in the PM.

Impact TRANS-7a in this DEIR identifies that Project-generated traffic, when added to other cumulative traffic by year 2030, would adversely impact this intersection. Recommended mitigation measures include optimizing the signal timing for the PM peak hour, and coordinating the signal timing change with the adjacent intersections that are in the same signal coordination group. However, improvements considered would have adverse effects on pedestrian and bicyclist safety, remove existing bicycle lanes, or are precluded by physical constraints, and therefore, the DEIR concluded that there are no feasible mitigation measures to completely mitigate the Project's impacts and the Project impacts at this intersection are significant and unavoidable.

The LOS results presented in the CBTP Study are not directly comparable to those presented in this DEIR because the CBTP Study assumes signal optimization and a longer cycle length (100 seconds compared to 90 seconds), which generally improves intersection operations when all other variables such as traffic volumes and lane geometry are held constant.

#3. Harrison Street / 27th Street / 24th Street / Bay Place (CBTP Study Intersection #10)

The CBTP Study recommended removal of the existing channelized right-turn lane at the northeast corner of the intersection and closure of the 24th Street leg (access only provided via right-turns from 27th Street). The additional space freed up by these modifications would be converted to pedestrian plaza and street landscaping.

Impact TRANS-7b in this DEIR identifies that Project-generated traffic, when added to other cumulative traffic by year 2030, would adversely impact this intersection. Recommended mitigation measures include optimizing the signal timing for the PM peak hour, coordinating the signal timing change with the adjacent intersections that are in the same signal coordination group, and prohibiting westbound left turns during the AM and PM peak hours.

After implementation of the mitigation measures, this intersection would operate at an acceptable LOS D in the AM peak hour. In the PM peak hour, this intersection would operate at an unacceptable LOS E, but the average delay for the overall intersection and for critical movements would be reduced to a level that would mitigate the Project's impacts at this intersection in 2030.

Although the changes proposed under the CBTP Study would generally improve pedestrian conditions at this intersection, they would generally not improve traffic operations, as removal of the channelized right-turn from southbound Harrison Street to westbound 27th Street and closure of the 24th Street leg would restrict available vehicle movements at the intersection and increase delay. An additional reason for the difference in LOS presented in this DEIR is the proposed mitigation measure of prohibition of westbound left turns

during the AM and PM peak hours—without mitigation, this DEIR indicates the intersection would operate similar to the CBTP Study (LOS F with over 120 seconds of intersection average delay).

#12. Harrison Street / Grand Avenue (CBTP Study Intersection #11)

The CBTP Study recommended only minor changes at this intersection, including addition of a bulbout on the northeast corner of the intersection and relocation of the nearside bus stop on the west side of Harrison Street to a farside location.

Impact TRANS-7d in this DEIR identifies that Project-generated traffic, when added to other cumulative traffic by year 2030, would increase the average intersection delay by more than two seconds during AM peak hour, which currently operates at LOS F under cumulative conditions without the Project. During the PM peak hour, the intersection would operate at LOS F under cumulative conditions without the Project, and the addition of Project-generated traffic would increase the v/c ratio by more than three percent.

Recommended mitigation measures include optimizing the signal timing for the PM peak hour, coordinating the signal timing change with the adjacent intersections that are in the same signal coordination group, and prohibiting southbound left turns during the AM peak hours (this movement is already prohibited in the PM peak period) with extinguishable message signs installed on the northbound and southbound approaches to enforce this prohibition.

After implementation of the mitigation measures, the intersection would operate at LOS E during the AM peak hour and LOS F during the PM peak hour. As a result, the impact would still remain significant because these measures alone would not be sufficient to completely mitigate the Project's impacts in 2030.

The difference in LOS and delay between the DEIR and the CBTP Study is primarily due to different volumes as a result of the use of different ACCMA travel demand models. In particular, there are substantial differences in baseline volumes on the northbound left-turn, eastbound right-turn, and westbound left-turn and through movements which stem from the use of different versions of the ACCMA model.

#49. Oakland Avenue/West MacArthur Boulevard/Santa Clara Avenue (CBTP Study Intersection #3)

The CBTP Study recommended changes at this intersection to include converting Oakland Avenue north of the West MacArthur Boulevard - Santa Clara Avenue intersection from one-way northbound to two-way travel. The two-way conversion requires a median on Oakland Avenue north of the intersection to facilitate the 1-way to 2-way conversion, widening of Oakland Avenue under the I-580 overpass to accommodate the 2-way conversion and bicycle lanes, and improved sidewalks. The Study also recommends a split-phase intersection signal to direct the new traffic movements. These modifications would degrade intersection operations to LOS D during both peak hours in 2035.

Impact TRANS-7k in this DEIR identifies that Project-generated traffic, when added to other cumulative traffic by year 2030, would adversely impact in the PM peak hour because the maximum increase in v/c ratio would exceed the three percent threshold of significance. Recommended mitigation measures include optimizing the signal timing for the PM peak hour, coordinating the signal timing change with the adjacent intersections that are in the same signal coordination group, and restriping the northeast Oakland Avenue approach from the current configuration of one shared through-left lane and two through lanes to one exclusive left-turn lane, one shared through-left lane, and one through lane.

After implementation of the mitigation measures, in the AM peak hour, this intersection would operate at an unacceptable LOS E, but the average delay for the overall intersection and for critical movements would be reduced to a level that would mitigate the Project's impacts at this intersection in 2030. During the PM peak hour, the intersection would operate at LOS D after implementation of the mitigation measure.

The LOS results presented in the CBTP Study are not directly comparable to those presented in this DEIR because the CBTP Study proposed substantial changes for this intersection, including conversion to two-way traffic along Oakland Avenue and fundamental shifts in traffic patterns to accommodate these changes in the roadway network. In particular, there would only be one northbound through lane along Oakland Avenue, and two new southbound right-turn lanes at this intersection. As a result, although the PM peak hour LOS results in the CBTP Study are similar to those presented in this DEIR, there are differences in AM peak hour LOS results.

#50. Harrison Street/ MacArthur Boulevard (Westbound) /Santa Clara Avenue (CBTP Study Intersection #2)

The CBTP Study recommended changes at this intersection to include converting Harrison Street north of the West MacArthur Boulevard - Santa Clara Avenue intersection from one-way southbound to two-way travel. The two-way conversion allows for a center median island with a pedestrian refuge at the Santa Clara intersection. The Study also recommended increasing the signal cycle length at this intersection to 100 seconds, which would improve the LOS in the AM from LOS E to LOS D. The CBTP Study concluded that in 2035 the intersection could operate at an acceptable LOS C during the PM peak hour,

Impact TRANS-7l in this DEIR identifies that Project-generated traffic, when added to other cumulative traffic by year 2030, would increase the average intersection delay by more than two seconds during AM peak hour, which currently operates at LOS F under cumulative conditions without the Project.

After implementation of the mitigation measures, the intersection would continue to operate at LOS F during the AM peak hour. As a result, the impact would still remain significant because these measures alone would not be sufficient to completely mitigate the Project's impacts in 2030.

The LOS results presented in the CBTP Study are not directly comparable to those presented in this DEIR because the CBTP Study proposed substantial changes for this intersection, including conversion to two-way traffic along Oakland Avenue and fundamental shifts in traffic patterns to accommodate these changes in the roadway network. In particular, there would be a new northbound travel lane along Harrison Street north of the intersection. As a result, although the PM peak hour LOS results in the CBTP Study are similar to those presented in this DEIR, there are some differences in AM peak hour LOS results.

#51. Oakland Avenue / Monte Vista Avenue (unsignalized) (CBTP Study Intersection #1)

The CBTP Study recommended changes at this intersection to including conversion of the westbound Oakland Avenue approach from a single all-movement lane to one exclusive left-turn lane, one exclusive through-lane, and one exclusive right-turn lane, which would result in LOS C during the AM peak hour and LOS F during the PM peak hour.

This DEIR identifies that the intersection would operate at LOS D during the AM peak hour and LOS F during the PM peak hour under cumulative conditions in 2030 with the Project. However, because the intersection would already meet peak hour traffic signal warrants under baseline conditions without the Project, the Project would not result in an impact at this intersection.

The difference in LOS between the CBTP Study and this DEIR is primarily a result of changes proposed by the CBTP Study to the westbound Oakland Avenue approach at this intersection. The DEIR assumes that the existing configuration of only one lane would remain in 2030, restricting the serviceability of this approach, but the CBTP Study stripes additional lanes on the approach, improving serviceability and reducing overall intersection average delay.

TABLE 1

Conclusion

In conclusion, while the two studies utilized different model years and have different intersection analysis results, traffic generated by the proposed project would not substantially change the characterization of traffic operations in Year 2030 as presented in this DEIR, or in Year 2035 as presented in the CBTP Study. Furthermore, this project is not responsible for implementing any of the Harrison/Oakland Avenue Study improvements for the reasons stated above.

APPENDIX G.13

Proposed Westbound Signal Phase Sequence for Intersection #3 (Harrison Street / 27th Street / 24th Street)

APPENDIX H

Phase 1 (South Tower Only) Transportation Analysis

Phase 1 (South Tower) Only Analysis

The Phase 1 (South Tower) Only analysis in this appendix has been prepared to analyze the potential environmental transportation impacts that would occur if only Phase 1 of the Proposed Project was developed.

Existing plus South Tower Conditions

Intersection Impacts

Impact TRANS-12: Phase I of the proposed Project, when added to existing traffic levels, would worsen level of service at area intersections. (Significant at intersections described below under Impacts TRANS-12a through TRANS-12d)

Existing plus South Tower Conditions traffic volumes are illustrated in **Figure 1a** through **Figure 1d**. **Table 1** summarizes the peak-hour LOS at the 51 study intersections under Existing plus Phase South Tower Conditions.

Average delay at some intersections would decrease under Existing plus South Tower Conditions due to greater growth on movements that are under capacity (non-critical movements) and underutilizing the green time allotted by the signal, thereby resulting in a higher vehicle throughput and reduced overall intersection average delay.

As shown in **Table 1**, the following intersections would operate at unacceptable conditions under Existing plus South Tower Conditions:

Outside Downtown Area

2. Oakland Avenue / Perry Place / I-580 Eastbound Ramps (LOS F in PM peak hour)
3. Harrison Street / 27th Street / 24th Street (LOS E in PM peak hour)
45. Grand Avenue / El Embarcadero (LOS F in PM peak hour)
47. Grand Avenue / MacArthur Boulevard (Eastbound) (LOS F in PM peak hour)

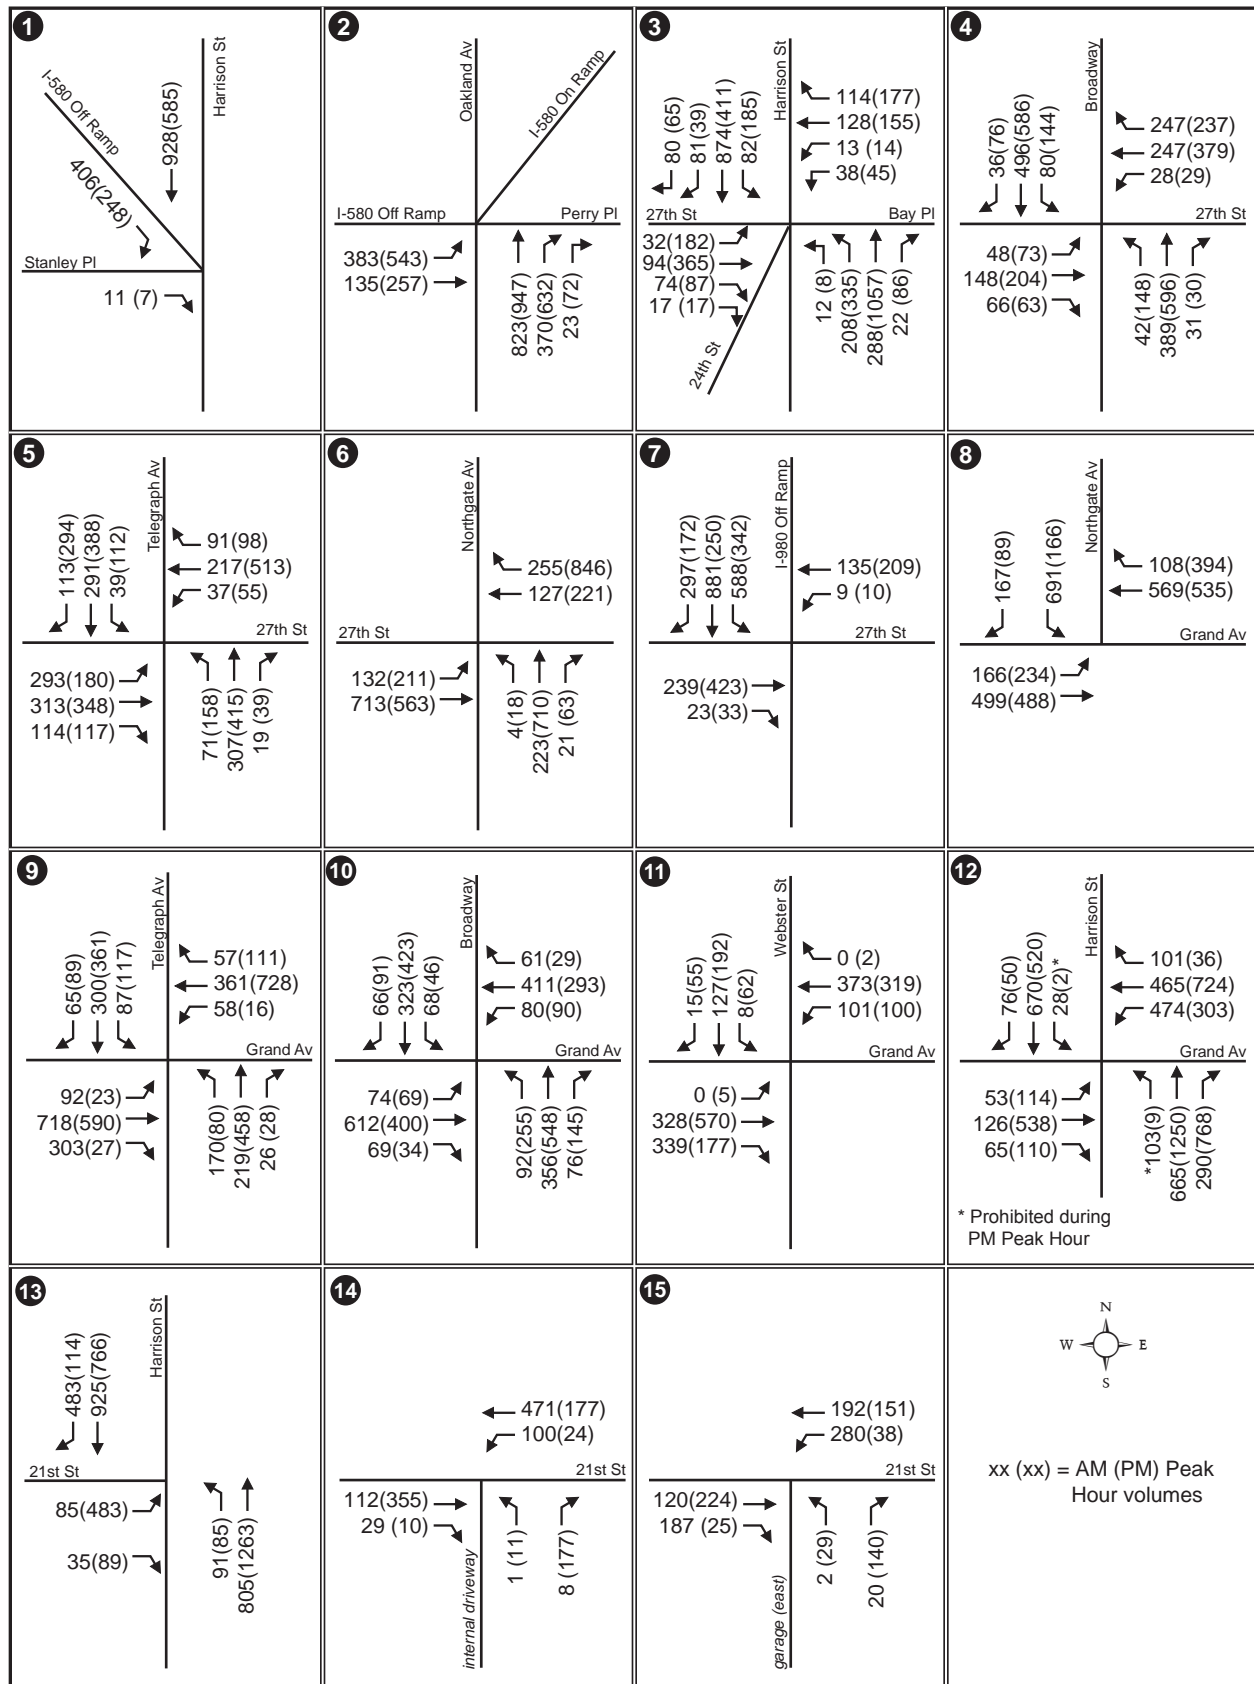

Within Downtown Area

42. Jackson Street / 6th Street / I-880 Northbound On-Ramp (LOS F in AM and PM peak hours)
44. Oak Street / 5th Street / I-880 Southbound On-Ramp (LOS F in PM peak hour)

The Project would not result in a significant impact at the following intersection:

- #42: Jackson Street / 6th Street / I-880 NB On-Ramp (AM / PM). Although the intersection would operate at LOS F during both the AM and PM peak hours under both Existing Conditions and Existing plus South Tower Conditions, the addition of South Tower-generated traffic would cause an increase in v/c ratio not above the three percent threshold.
- #44: Oak Street / 5th Street / I-880 SB On-Ramp (PM). Although the intersection would operate at LOS F during the PM peak hour under both Existing Conditions and Existing plus South Tower Conditions, the addition of South Tower-generated traffic would not cause an increase in v/c ratio above the three percent threshold.

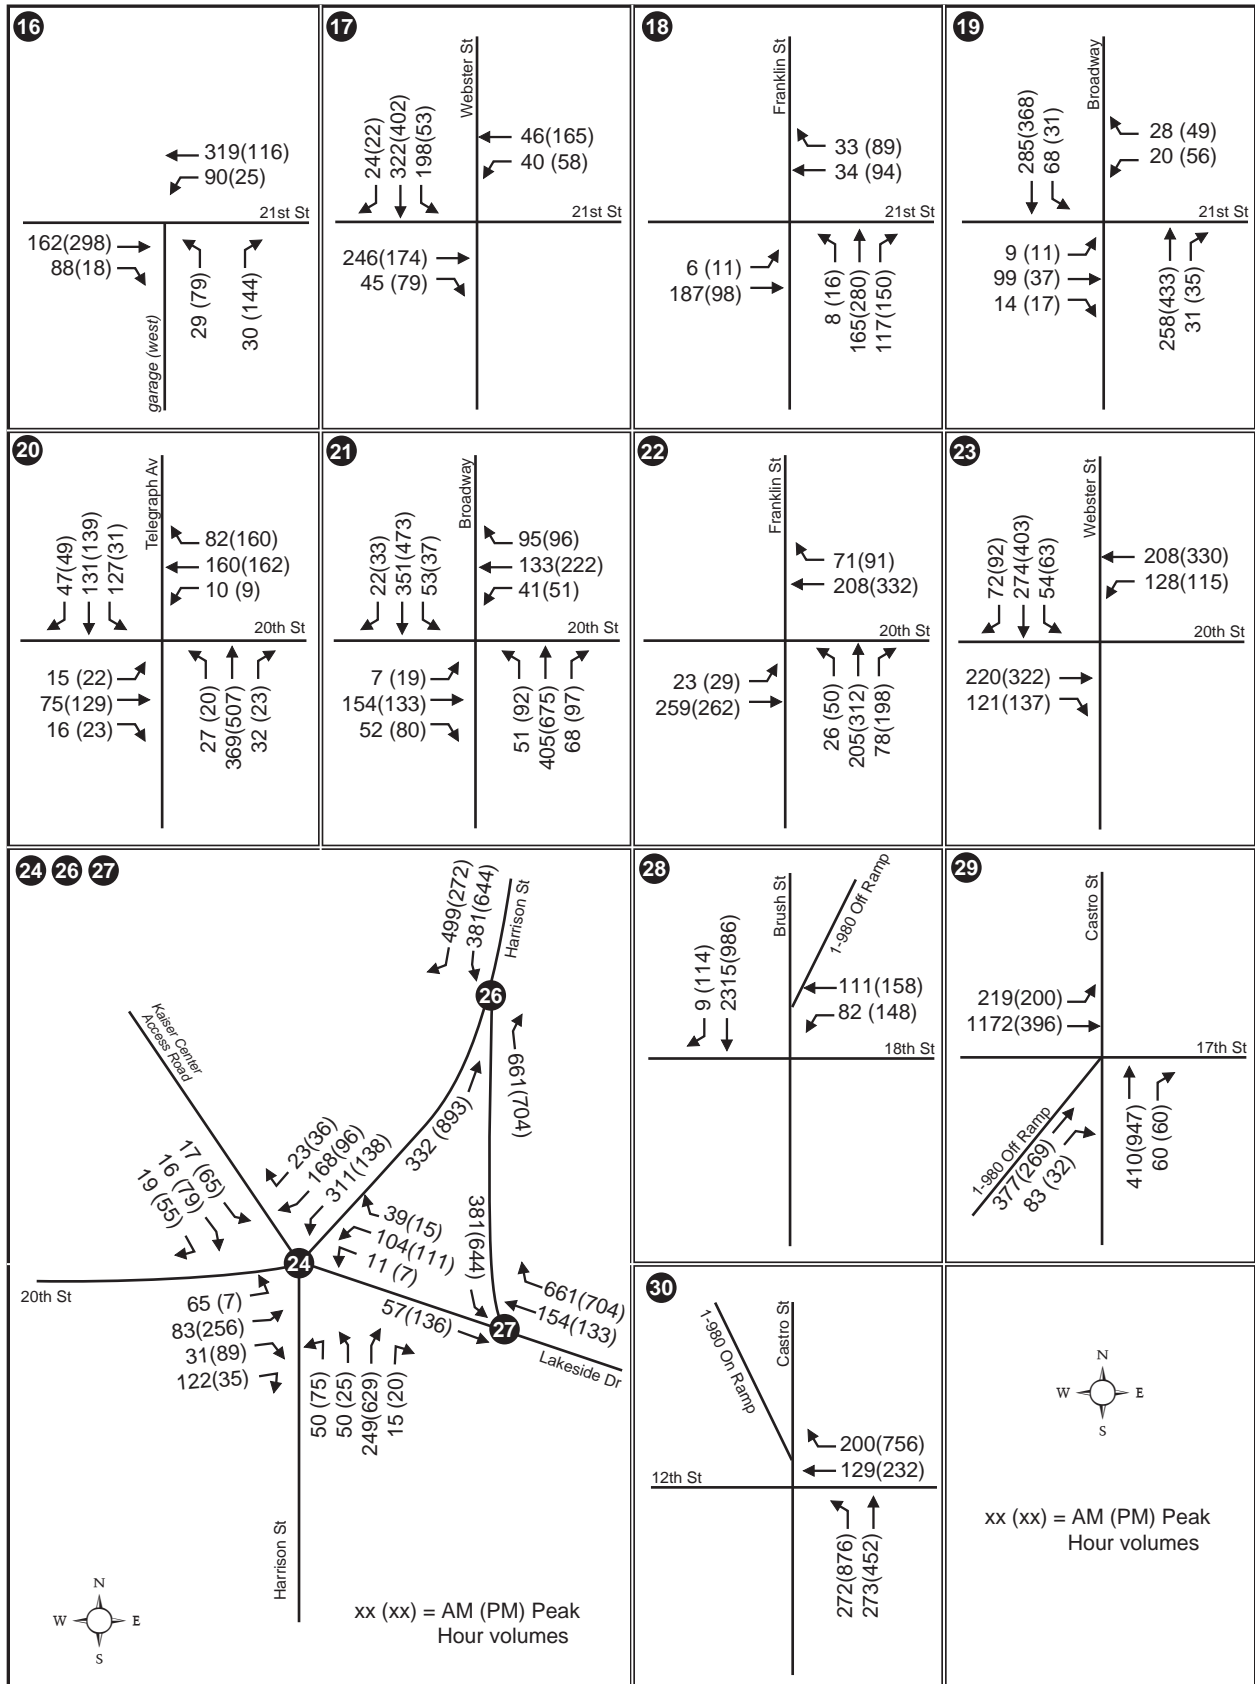

Impacts due to the South Tower at the remaining intersections above are discussed below.

^a SSSC = Side street stop controlled intersection; AWSC = All-way stop controlled intersection

^b The LOS and delay for side street stop controlled intersections represent the worst traffic movement or approach. The LOS and delay for signalized intersections and all-way stop controlled intersections represent the average delay for all traffic movements.

^c The Project would eliminate this intersection.

SOURCE: AECOM, 2010.

Impact TRANS-12a: Phase I of the proposed Project, when added to existing traffic levels, would increase the v/c ratio by more than three percent during the PM peak hour at Intersection #2 (Oakland Avenue / Perry Place / I-580 Eastbound Ramps) (Existing), which currently operates at an unacceptable LOS F during the PM peak hour under Existing Conditions. (Significant)

Because delay values over 120 seconds tend to increase exponentially and are thus generally considered unreliable, the increase in v/c ratio as a result of Project traffic was used to evaluate the impact. The intersection operates with a v/c ratio of 0.98 under Existing Conditions and would operate with a v/c ratio of 1.16 under Existing plus South Tower Conditions for the PM peak hour. Because the increase in v/c ratio would be 18 percent, which is greater than the three percent threshold of significance, the Project would result in a significant impact at this intersection.

Mitigation Measure TRANS-12a: Implement the following measures at the Oakland Avenue / Perry Place / I-580 Eastbound Ramps intersection:

- Optimize the traffic signal (to include determination of allocation of green time for each intersection approach) for the PM peak period in tune with the relative traffic volumes on those approaches.
- Coordinate the signal timing changes at this intersection with the adjacent intersections (e.g., Oakland Avenue / MacArthur Boulevard) that are in the same signal coordination group.

To implement this measure, the Project Applicant shall submit the following to City of Oakland's Transportation Services Division (TSD) for review and approval:

- Plans, Specifications, and Estimates (PS&E) to modify the intersection. All elements shall be designed to City standards in effect at the time of construction, and all new or upgraded signals should include these enhancements. All other facilities supporting vehicle travel and alternative modes through the intersection should be brought up to both City standards and ADA standards (according to Federal and State Access Board guidelines) at the time of construction. Current City Standards call for the elements listed below:
 - 2070L Type Controller
 - GPS communication (clock)
 - Accessible pedestrian crosswalks according to Federal and State Access Board guidelines
 - Full actuation (video detection, pedestrian push buttons, bicycle detection)
 - Accessible Pedestrian Signals, audible and tactile according to Federal Access Board guidelines
 - Countdown Pedestrian Signals
 - Fiber signal interconnect and communication to City Traffic Management Center for corridors identified in the City's ITS Master Plan for a maximum of 600 feet
 - Signal timing plans for the signals in the coordination group.

The project sponsor shall fund, prepare, and install the approved plans and improvements.

Because the delays at this intersection are primarily on the northbound right turn to the I-580 Eastbound On-Ramp and Perry Place, the existing crosswalk on the southeast side of the intersection (across I-580 Eastbound On-Ramp / Perry Place) could be repositioned to the northwest side of the intersection (across the I-580 Eastbound Off-Ramp), providing more green time to the northbound right-turn. However, this would require pedestrians to cross the I-580 Westbound Off-Ramp on the north side of Oakland Avenue between Perry Place and MacArthur Boulevard. Because this on-ramp is uncontrolled and visibility can be poor, this configuration would likely present more safety issues than the existing crosswalk across the eastbound on-ramp at this intersection, which is a signalized crossing.

Geometric modifications to increase capacity on the northbound right-turn would also be infeasible. The I-580 Eastbound On-Ramp is restricted to one lane, precluding the provision of an additional turn lane onto the on-ramp. A Class 2 bicycle lane has also been recently striped on Oakland Avenue, and adding an additional exclusive right-turn lane could require the removal of the bicycle lane or a reduction to its attractiveness, or could present safety issues for bicycles. Substantial capacity improvements such as additional travel lanes would also conflict with the goals of the Harrison Street / Oakland Avenue CTP.

In addition, signal optimization at this location would require approval of the change by Caltrans, making implementation of the proposed mitigation measure uncertain. Given these considerations, there are no feasible measures to completely mitigate the South Tower's impacts. Therefore, the South Tower impact at this intersection would be significant and unavoidable.

Significance after Implementation of Mitigation: Significant and Unavoidable.

If both Phase I and Phase II of the Project were built, this intersection would also be a significant and unavoidable impact under Existing plus Project (Phase I and Phase II) Conditions.

Impact TRANS-12b: Phase I of the proposed Project, when added to existing traffic levels, would degrade the vehicle level of service from an acceptable LOS D to an unacceptable LOS F during the PM peak hour at *Intersection #3 (Harrison Street / 27th Street / 24th Street) (Existing). (Significant)*

Mitigation Measure TRANS-12b: Implement the following measures at the Harrison Street / 27th Street / 24th Street intersection:

- Prohibit westbound left turns from Bay Place (to Harrison Street and 24th Street) during the PM peak period.
- Optimize the traffic signal (to include determination of allocation of green time for each intersection approach) for the PM peak period in tune with the relative traffic volumes on those approaches.

-
- Coordinate the signal timing at this intersection with the adjacent intersections (e.g., Harrison Street / Grand Avenue and Harrison Street / Westlake Middle School Driveway) that are in the same signal coordination group.

To implement this measure, the Project Applicant shall submit the following to TSD for review and approval:

- PS&E to modify the intersection. All elements shall be designed to City standards in effect at the time of construction, and all new or upgraded signals should include these enhancements. All other facilities supporting vehicle travel and alternative modes through the intersection should be brought up to both City standards and ADA standards (according to Federal and State Access Board guidelines) at the time of construction. Current City Standards call for the elements listed below:
 - 2070L Type Controller
 - GPS communication (clock)
 - Accessible pedestrian crosswalks according to Federal and State Access Board guidelines
 - City Standard ADA wheelchair ramps
 - Full actuation (video detection, pedestrian push buttons, bicycle detection)
 - Accessible Pedestrian Signals, audible and tactile according to Federal Access Board guidelines
 - Countdown Pedestrian Signals
 - Fiber signal interconnect and communication to City Traffic Management Center for corridors identified in the City's ITS Master Plan for a maximum of 600 feet
 - Signal timing plans for the signals in the coordination group.

The project sponsor shall fund, prepare, and install the approved plans and improvements.

The 59 vehicles making these movements during the PM peak hour (45 vehicles to southbound Harrison Street and 14 vehicles to westbound 24th Street) would likely divert to the westbound through movement at this intersection or use other intersections in the area. Given that the volumes are relatively low, the diversion of traffic as a result of the left-turn prohibition would not result in substantial secondary impacts. By prohibiting westbound left turns, the green times can be reallocated to the northbound and southbound through Harrison Street movements. After implementation of the mitigation measure, the intersection would operate at an acceptable LOS C in the PM peak hour.

However, the proposed mitigation measure would represent a less-than-ideal solution and could potentially still result in confusion for drivers who do not regularly use this intersection. This confusion could potentially result in drivers attempting to make abrupt lane changes out of the shared through-left lane or make prohibited traffic movements under the assumption that they have the “right of way.”

Significance after Implementation of Mitigation: Conservatively deemed Significant and Unavoidable. If the City rejects the specific implementation approach described for Mitigation

Measure TRANS-12b for the Project, and no other feasible options are identified, then the impact at this location would be Significant and Unavoidable. Alternatively, if the City accepts the approach identified, the Project impact at this location would be Less than Significant.

If both Phase I and Phase II of the Project were built, this intersection would also be a conservatively deemed significant and unavoidable impact under Existing plus Project (Phase I and Phase II) Conditions.

Impact TRANS-12c: Phase I of the proposed Project, when added to existing traffic levels, would increase the average intersection vehicle delay by more than two seconds during the PM peak hour at *Intersection #45 (Grand Avenue / El Embarcadero)* (Existing), which currently operates at an unacceptable LOS F during the PM peak hour under Existing Conditions. (Significant)

Mitigation Measure TRANS-12c: Implement the following measures at the Grand Avenue / El Embarcadero intersection:

- Optimize the traffic signal (to include determination of allocation of green time for each intersection approach) for the PM peak period in tune with the relative traffic volumes on those approaches.
- Coordinate the signal timing at this intersection with the adjacent intersections (e.g., Grand Avenue / Mac Arthur Boulevard and Lakeshore Drive / El Embarcadero) in the same coordination group.

To implement this measure, the Project Applicant shall submit the following to TSD for review and approval:

- PS&E to modify the intersection. All elements shall be designed to City standards in effect at the time of construction, and all new or upgraded signals should include these enhancements. All other facilities supporting vehicle travel and alternative modes through the intersection should be brought up to both City standards and ADA standards (according to Federal and State Access Board guidelines) at the time of construction. Current City Standards call for the elements listed below:
 - 2070L Type Controller
 - GPS communication (clock)
 - Accessible pedestrian crosswalks according to Federal and State Access Board guidelines
 - City Standard ADA wheelchair ramps
 - Full actuation (video detection, pedestrian push buttons, bicycle detection)
 - Accessible Pedestrian Signals, audible and tactile according to Federal Access Board guidelines
 - Countdown Pedestrian Signals

-
- Fiber signal interconnect and communication to City Traffic Management Center for corridors identified in the City's ITS Master Plan for a maximum of 600 feet
 - Signal timing plans for the signals in the coordination group.

The project sponsor shall fund, prepare, and install the approved plans and improvements.

After implementation of this measure, the intersection (located outside the Downtown area) is expected to operate at an acceptable LOS D in the PM peak hour, thus mitigating the South Tower's impact at this intersection. However, since the Grand Avenue / El Embarcadero intersection was counted (in November 2008) prior to its modification, new level of service calculations will be needed based on new counts (to be taken after the completion of scheduled modifications to the Lakeshore Drive / Mac Arthur Boulevard intersection). This analysis should be provided to TSD for review and determination whether or not the above improvement measures should be implemented.

Significance after Implementation of Mitigation: Less than Significant.

If both Phase I and Phase II of the Project were built, this intersection would also be a less than significant after mitigation impact under Existing plus Project (Phase I and Phase II) Conditions.

Impact TRANS-12d: Buildout of the proposed Project (Phase I and II), when added to existing traffic levels, would degrade the vehicle level of service from an unacceptable LOS E to an unacceptable LOS F during the PM peak hour at *Intersection #47 (Grand Avenue / MacArthur Boulevard (Eastbound) / I-580 Eastbound Off-Ramp) (Existing)*. (Significant)

Mitigation Measure TRANS-12d: Implement the following measures at the Grand Avenue / MacArthur Boulevard (Eastbound) intersection:

- Optimize the traffic signal (to include determination of allocation of green time for each intersection approach) for the PM peak period in tune with the relative traffic volumes on those approaches.
- Coordinate the signal timing at this intersection with the adjacent intersections (e.g., Grand Avenue / El Embarcadero and Mac Arthur Boulevard / Lakeshore Drive) in the same signal coordination group.

To implement this measure, the Project Applicant shall submit the following to TSD for review and approval:

- PS&E to modify the intersection. All elements shall be designed to City standards in effect at the time of construction, and all new or upgraded signals should include these enhancements. All other facilities supporting vehicle travel and alternative modes through the intersection should be brought up to both City standards and ADA standards (according to Federal and State Access Board guidelines) at the time of construction. Current City Standards call for the elements listed below:
 - 2070L Type Controller

-
- GPS communication (clock)
 - Accessible pedestrian crosswalks according to Federal and State Access Board guidelines
 - City Standard ADA wheelchair ramps
 - Full actuation (video detection, pedestrian push buttons, bicycle detection)
 - Accessible Pedestrian Signals, audible and tactile according to Federal Access Board guidelines
 - Countdown Pedestrian Signals
 - Fiber signal interconnect and communication to City Traffic Management Center for corridors identified in the City's ITS Master Plan for a maximum of 600 feet
 - Signal timing plans for the signals in the coordination group.

The project sponsor shall fund, prepare, and install the approved plans and improvements.

After implementation of this measure, the intersection (located outside the Downtown area) is expected to operate at an acceptable LOS D in the PM peak hour, thus mitigating the South Tower's impact at this intersection. However, since the Grand Avenue / Mac Arthur Boulevard intersection was counted in November 2008, new level of service calculations will be needed based on new counts (to be taken after the completion of scheduled modifications to the Lakeshore Drive / Mac Arthur Boulevard intersection). This analysis should be provided to TSD for review and determination whether or not the above improvement measures should be implemented.

Significance after Implementation of Mitigation: Less than Significant.

If both Phase I and Phase II of the Project were built, this intersection would also be a significant and unavoidable impact under Existing plus Project (Phase I and Phase II) Conditions.

Roadway Impacts

Table 2 summarizes peak-hour LOS for the study roadway segments under Existing plus South Tower Conditions and indicates that South Tower-generated traffic is not expected to have a significant impact on any of the 12 study roadway segments.

Cumulative (2030) plus South Tower Conditions

This section provides the results of the analysis of Cumulative (2030) plus South Tower Conditions. Near Term (2015) plus Project (Phase I or South Tower) Conditions are addressed in Section IV.L of the Draft Environmental Impact Report (DEIR) for the Kaiser Center Office Project.

Intersection Impacts

Impact TRANS-13: Under 2030 cumulative conditions, Phase I of the proposed Project would worsen level of service conditions at area intersections. (Significant at intersections described below under Impacts TRANS-13a through TRANS-13e)

Cumulative (2030) plus South Tower Conditions traffic volumes are illustrated in **Figure 2a** through **Figure 2d**. **Table 3** summarizes the peak hour LOS at the 51 study intersections under Cumulative (2030) plus South Tower Conditions.

Average delay at some intersections would decrease under Cumulative (2030) plus South Tower Conditions (when compared to Cumulative Without Project Conditions) due to greater growth on movements which are under capacity (non-critical movements) and underutilizing the green time allotted by the signal, thereby resulting in a higher vehicle throughput and reduced overall intersection average delay.

As shown in Table 2, the following intersections would operate at unacceptable conditions under Cumulative (2030) plus South Tower Conditions:

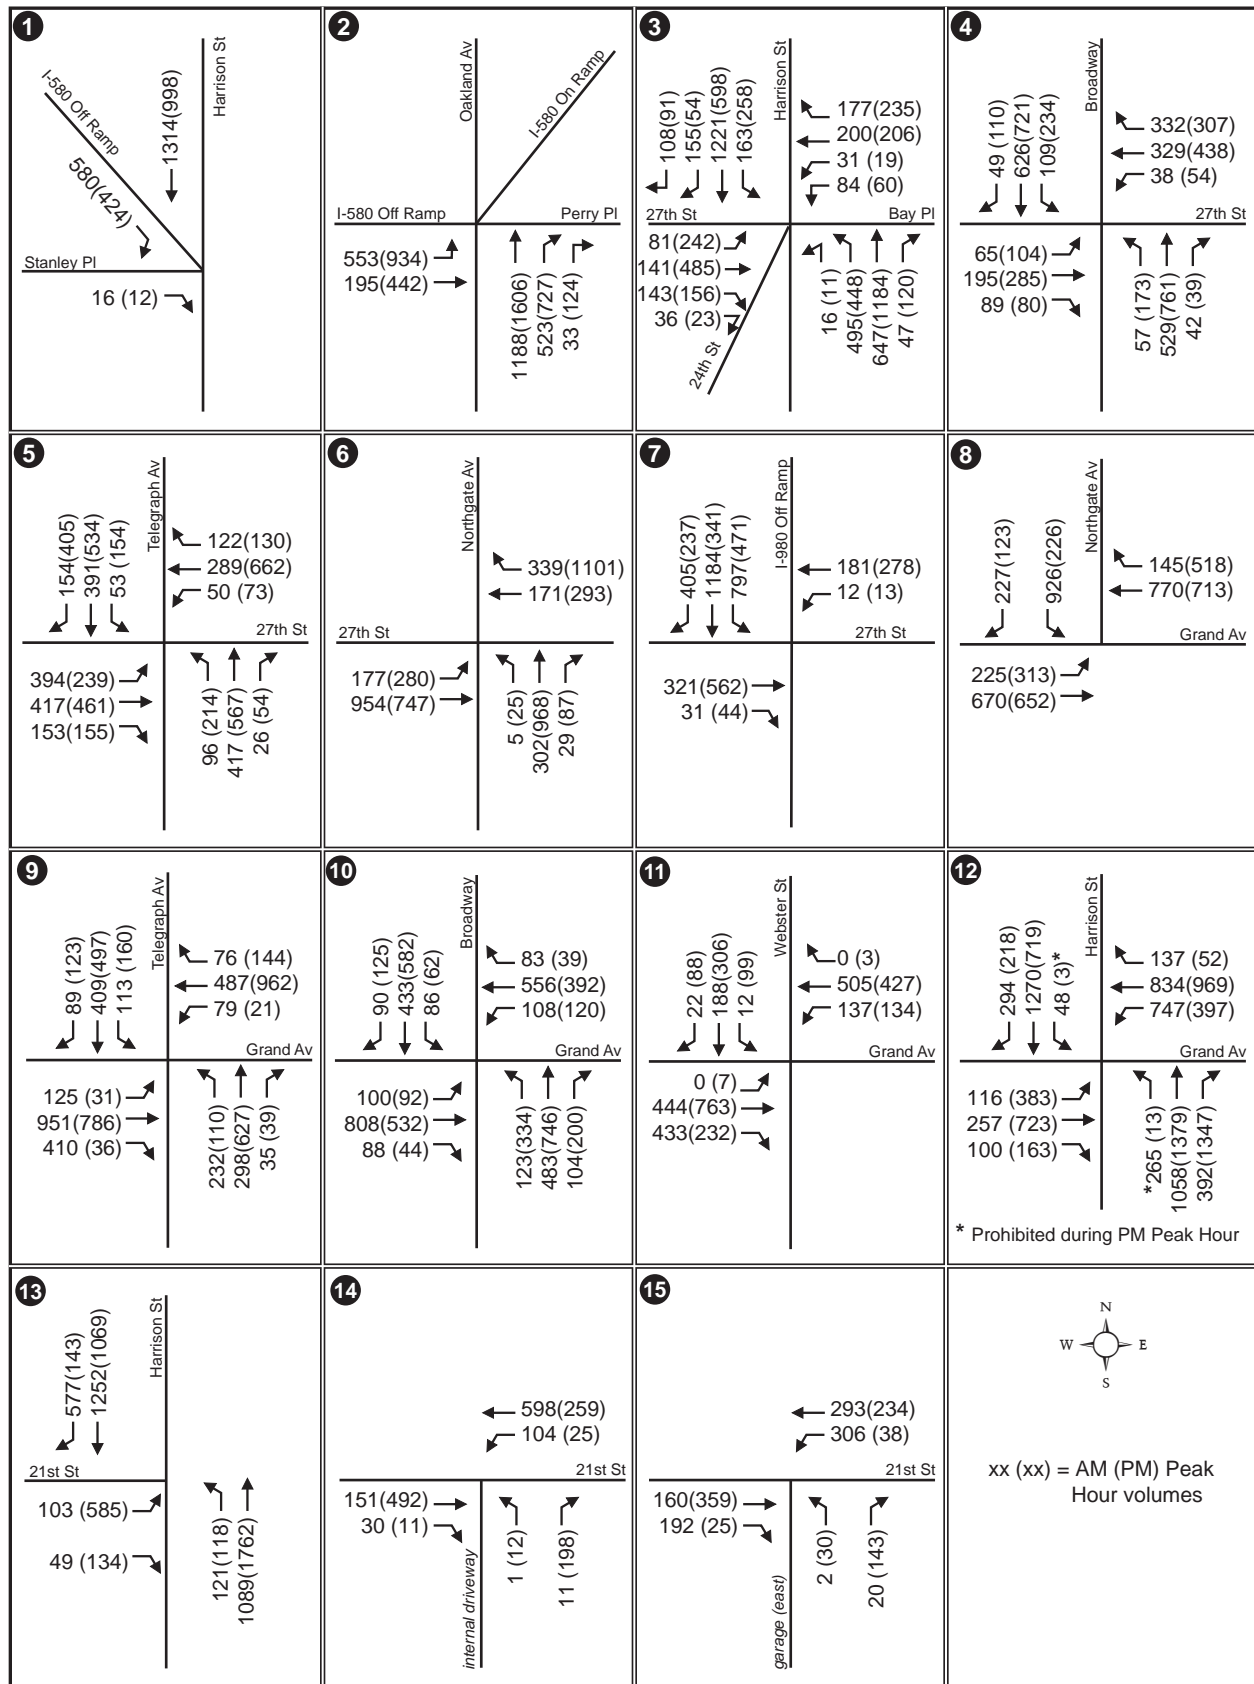

Outside Downtown Area

1. Harrison Street / Stanley Place / I-580 EB Off-Ramp (LOS F in AM peak hour)
2. Oakland Avenue / Perry Place / I-580 Eastbound Ramps (LOS F in AM and PM peak hours)
3. Harrison Street / 27th Street / 24th Street (LOS F in AM and PM peak hours)
5. Telegraph Avenue / 27th Street (LOS F in PM peak hour)
45. Grand Avenue / El Embarcadero (LOS F in PM peak hour)
47. Grand Avenue / MacArthur Boulevard (Eastbound) (LOS E in AM peak hour, and LOS F in PM peak hour)

Bold indicates significant impact.

^a SSSC = Side street stop controlled intersection; AWSC = All-way stop controlled intersection

^b The LOS and delay for side street stop controlled intersections represent the worst traffic movement or approach. The LOS and delay for signalized intersections and all-way stop controlled intersections represent the average delay for all traffic movements.

^c The Project would eliminate this intersection.

^d After reconfiguration of Intersection 24 and Intersection 26, this intersection would be eliminated.

SOURCE: AECOM, 2010.

-
48. Lakeshore Avenue / MacArthur Boulevard (EB) / I-580 Eastbound On-Ramp (LOS F in AM and PM peak hours)
 49. Oakland Avenue / MacArthur Boulevard (WB) / Santa Clara Avenue / I-580 Westbound Off-Ramp (LOS F in AM peak hour)
 50. Harrison Street / MacArthur Boulevard (Westbound) / Santa Clara Avenue (LOS F in AM peak hour)
 51. Oakland Avenue / Monte Vista Avenue / Vernon Street (LOS F in PM peak hour)

Within Downtown Area

12. Harrison Street / Grand Avenue (LOS F in AM and PM peak hours)
24. Harrison Street / 20th Street / Kaiser Center Access Road (LOS F in PM peak hour)
32. Oak Street / 14th Street (LOS F in PM peak hour)
40. Oak Street / 7th Street (LOS F in PM peak hour)
42. Jackson Street / 6th Street / I-880 Northbound On-Ramp (LOS F in AM and PM peak hours)
44. Oak Street / 5th Street / I-880 Southbound On-Ramp (LOS F in AM and PM peak hours)

South Tower-generated traffic would not result in a significant impact at the following intersections:

- #1: Harrison Street / Stanley Place / I-580 EB Off-Ramp (AM). Although the side-street service level at this unsignalized intersection would operate at LOS F during the AM peak hour under Near-Term (2030) plus South Tower Conditions, the intersection would not satisfy the California MUTCD peak-hour signal warrant.
- #45: Grand Avenue / El Embarcadero (PM). Although the intersection would operate at LOS F during the PM peak hour under both Cumulative (2030) without Project Conditions and Cumulative (2030) plus South Tower Conditions, the addition of South Tower-generated traffic would not cause an increase in v/c ratio above the three percent threshold.
- #47: Grand Avenue / MacArthur Boulevard (PM). Although the intersection would operate at LOS F during the PM peak hour under both Cumulative (2030) without Project Conditions and Cumulative (2030) plus South Tower Conditions, the addition of South Tower-generated traffic would not cause an increase in v/c ratio above the three percent threshold.
- #48: Lakeshore Avenue / El Embarcadero (PM). Although the intersection would operate at LOS F during the PM peak hour under both Cumulative (2030) without Project Conditions and Cumulative (2030) plus South Tower Conditions, the addition of South Tower-generated traffic would not cause an increase in v/c ratio above the three percent threshold.
- #49: Oakland Avenue / MacArthur Boulevard / I-580 WB Off-ramp (AM). Although the intersection would operate at LOS F during the AM peak hour under both Cumulative (2030) without Project Conditions and Cumulative (2030) plus South Tower Conditions, the addition of South Tower-generated traffic would not cause an increase in v/c ratio above the three percent threshold.

- #32: Oak Street / 14th Street (PM). Although the intersection would operate at LOS F during the PM peak hour under both Cumulative (2030) without Project Conditions and Cumulative (2030) plus South Tower Conditions, the addition of South Tower-generated traffic would not cause an increase in average intersection delay above the two-second threshold, nor an increase in critical movement delay above the four-second threshold.
- #40: Oak Street / 7th Street (PM). Although the intersection would operate at LOS F during the PM peak hour under both Cumulative (2030) without Project Conditions and Cumulative (2030) plus South Tower Conditions, the addition of South Tower-generated traffic would not cause an increase in average intersection delay above the two-second threshold, nor an increase in critical movement delay above the four-second threshold.
- #42: Jackson Street / 6th Street / I-880 NB On-Ramp (AM / PM). Although the intersection would operate at LOS F during the AM and PM peak hours under both Cumulative (2030) without Project Conditions and Cumulative (2030) plus South Tower Conditions, the addition of South Tower-generated traffic would not cause the v/c ratio to increase above the three percent threshold.
- #44: Oak Street / 5th Street / I-880 SB On-Ramp (AM / PM). Although the intersection would operate at LOS F during the AM and PM peak hour under both Cumulative (2030) without Project Conditions and Cumulative (2030) plus South Tower Conditions, the addition of South Tower-generated traffic would not cause the v/c ratio to exceed the three percent threshold.
- #51: Oakland Avenue / Monte Vista Avenue / Vernon Street (PM). Although the intersection would operate at LOS F during the PM peak hour under both Cumulative (2030) without Project Conditions and Cumulative (2030) plus South Tower Conditions, the intersection is expected to be already meet the peak hour signal warrant under Cumulative (2030) without Project Conditions. Therefore, the Project would not result in a significant impact at this intersection.

Impacts due to South Tower-generated traffic at the remaining intersections above are discussed below.

Impact TRANS-13a: Under 2030 cumulative conditions, Phase I of the proposed Project would degrade the vehicle level of service from an unacceptable LOS E to an unacceptable LOS F during the AM peak hour and increase the v/c ratio by more than three percent during the PM peak hour at *Intersection #2 (Oakland Avenue / Perry Place / I-580 Eastbound Ramps)* (2030), which would operate at an unacceptable LOS F during the PM peak hour under Cumulative (2030) without Project Conditions. (Significant)

For the PM peak hour, because delay values over 120 seconds tend to increase exponentially and are thus generally considered unreliable, the increase in v/c ratio as a result of Project traffic was instead evaluated. The intersection would operate with a v/c ratio of 1.43 under Cumulative (2030) without Project Conditions and 1.49 under Cumulative (2030) plus South Tower Conditions in the PM peak hour. Because the increase in v/c ratio would be 6 percent, which is above the three percent threshold of significance, South Tower-generated traffic would result in a significant impact at this intersection.

Mitigation Measure TRANS-13a: Implement Mitigation Measure TRANS-12a.

This measure alone should be sufficient to completely mitigate the South Tower impacts at this intersection.

Significance after Implementation of Mitigation: Less than Significant.

If both Phase I and Phase II of the Project were built, this intersection would also be a significant and unavoidable impact under Cumulative (2030) plus Project (Phase I and Phase II) Conditions.

Impact TRANS-13b: Under 2030 cumulative conditions, Phase I of the proposed Project would increase the average intersection vehicle delay by more than two seconds during the AM peak hour and degrade the vehicle level of service from an unacceptable LOS E to an unacceptable LOS F during the PM peak hour at *Intersection #3 (Harrison Street / 27th Street / 24th Street)* (2030), which would operate at LOS F during the AM peak hour under Cumulative (2030) without Project Conditions. (Significant)

Mitigation Measure TRANS-13b: Implement Mitigation Measure TRANS-12b, and also prohibit westbound left turns during the AM peak hour (in addition to the PM peak hour).

After implementation of the mitigation measure, the intersection would operate at an acceptable LOS D in both the AM and PM peak hours, mitigating the South Tower impacts at this intersection.

As discussed for Mitigation Measure TRANS-12b, however, the proposed mitigation measure would represent a less-than-ideal solution and could potentially result in driver confusion.

Significance after Implementation of Mitigation: Conservatively deemed Significant and Unavoidable. If the City rejects the specific implementation approach described for Mitigation Measure TRANS-12b for the Project, and no other feasible options are identified, then the impact at this location would be Significant and Unavoidable. Alternatively, if the City accepts the approach identified, the Project impact at this location would be Less than Significant.

If both Phase I and Phase II of the Project were built, this intersection would also be a conservatively deemed significant and unavoidable impact under Cumulative (2030) plus Project (Phase I and Phase II) Conditions.

Impact TRANS-13c: Under 2030 cumulative conditions, Phase I of the proposed Project would increase average intersection vehicle delay by more than four seconds during the PM peak hour at *Intersection #5 (Telegraph Avenue / 27th Street)* (2030), which would operate at an unacceptable LOS E during the PM peak hour under Cumulative (2030) without Project Conditions. (Significant)

Mitigation Measure TRANS-13c: Implement Mitigation Measure TRANS-5d at Telegraph Avenue / 27th Street:

-
- Optimize the traffic signal (to include determination of allocation of green time for each intersection approach) for the PM peak hour in tune with the relative traffic volumes on those approaches.
 - Coordinate the signal timing changes at this intersection with the adjacent intersections (e.g., Telegraph Avenue / 26th Street and 27th Street / Northgate Avenue-SR 24 EB On-ramp) that are in the same signal coordination group.
 - Redesign the signal plan to give the northbound Telegraph Avenue left-turn movement protected-permitted phasing.

To implement this measure, the Project Applicant shall submit the following to TSD for review and approval:

- PS&E to modify the intersection. All elements shall be designed to City standards in effect at the time of construction, and all new or upgraded signals should include these enhancements. All other facilities supporting vehicle travel and alternative modes through the intersection should be brought up to both City standards and ADA standards (according to Federal and State Access Board guidelines) at the time of construction. Current City Standards call for the elements listed below:
 - 2070L Type Controller
 - GPS communication (clock)
 - Accessible pedestrian crosswalks according to Federal and State Access Board guidelines
 - City Standard ADA wheelchair ramps
 - Full actuation (video detection, pedestrian push buttons, bicycle detection)
 - Accessible Pedestrian Signals, audible and tactile according to Federal Access Board guidelines
 - Countdown Pedestrian Signals
 - Fiber signal interconnect and communication to City Traffic Management Center for corridors identified in the City's ITS Master Plan for a maximum of 600 feet
 - Signal timing plans for the signals in the coordination group.

The project sponsor shall fund, prepare, and install the approved plans and improvements.

After implementation of the mitigation measure, the intersection would operate at an unacceptable LOS E in the PM peak hour, but the average delay for the overall intersection and for critical movements would be reduced to less than Cumulative (2030) without Project conditions, mitigating the South Tower's impacts at this intersection.

Significance after Implementation of Mitigation: Less than Significant.

If both Phase I and Phase II of the Project were built, this intersection would also be a less than significant after mitigation impact under Cumulative (2030) plus Project (Phase I and Phase II) Conditions.

Impact TRANS-13d: Under 2030 cumulative conditions, Phase I of the proposed Project would increase the average intersection delay by more than two seconds during the AM peak hour at Intersection #12 (Harrison Street / Grand Avenue) (2030), which would operate at an unacceptable LOS F during the AM peak hour under Cumulative (2030) without Project Conditions. (Significant)

For the PM peak hour, because delay values over 120 seconds tend to increase exponentially and are thus generally considered unreliable, the increase in v/c ratio as a result of South Tower-generated traffic was instead evaluated. The intersection would operate with a v/c ratio of 1.32 under Cumulative (2030) without Project Conditions and 1.37 under Cumulative (2030) plus South Tower Conditions in the PM peak hour. Because the increase in v/c ratio would be 5 percent, which is above the three percent threshold of significance, South Tower-generated traffic would result in a significant impact at this intersection.

Mitigation Measure TRANS-13d: Implement Mitigation Measure TRANS-3c, and also prohibit southbound Harrison Street left turns in the AM peak period (this movement is already prohibited in the PM peak period). To help enforce the prohibition, extinguishable message signs should be installed on the northbound and southbound approaches.

These measures alone would not be sufficient to completely mitigate the South Tower impacts at this intersection, but as discussed for Impact TRANS-3c, there are no feasible mitigation measures to completely mitigate the South Tower impacts. Therefore, the South Tower impacts at this intersection are significant and unavoidable.

Significance after Implementation of Mitigation: Significant and Unavoidable.

If both Phase I and Phase II of the Project were built, this intersection would also be a significant and unavoidable impact under Cumulative (2030) plus Project (Phase I and Phase II) Conditions.

Impact TRANS-13e: Under 2030 cumulative conditions, Phase I of the proposed Project would degrade the vehicle level of service from an acceptable LOS D to an unacceptable LOS F during the PM peak hour at Intersection #24 (Harrison Street / 20th Street / Kaiser Center Access Road) (2030). (Significant)

Mitigation Measure TRANS-13e: Implement Mitigation Measure TRANS-1c at Harrison Street / 20th Street / Kaiser Center Access Road:

- Optimize the traffic signal (to include determination of allocation of green time for each intersection approach) for the PM peak period in tune with the relative traffic volumes on those approaches.
- Coordinate the signal timing at this intersection with the adjacent intersections (e.g., Webster Street / 20th Street and Harrison Street / Lakeside Drive) in the same signal coordination group.

To implement this measure, the Project Applicant shall submit the following to TSD for review and approval:

- PS&E to modify the intersection. All elements shall be designed to City standards in effect at the time of construction, and all new or upgraded signals should include these enhancements. All other facilities supporting vehicle travel and alternative modes through the intersection should be brought up to both City standards and ADA standards (according to Federal and State Access Board guidelines) at the time of construction. Current City Standards call for the elements listed below:
 - 2070L Type Controller
 - GPS communication (clock)
 - Accessible pedestrian crosswalks according to Federal and State Access Board guidelines
 - City Standard ADA wheelchair ramps
 - Full actuation (video detection, pedestrian push buttons, bicycle detection)
 - Accessible Pedestrian Signals, audible and tactile according to Federal Access Board guidelines
 - Countdown Pedestrian Signals
 - Fiber signal interconnect and communication to City Traffic Management Center for corridors identified in the City's ITS Master Plan for a maximum of 600 feet
 - Signal timing plans for the signals in the coordination group.

The project sponsor shall fund, prepare, and install the approved plans and improvements. After implementation of the mitigation measure, the intersection (located within the Downtown area) would operate at an acceptable LOS E in the PM peak hour.

Significance after Implementation of Mitigation: Less than Significant.

If both Phase I and Phase II of the Project were built, this intersection would also be a less than significant after mitigation impact under Cumulative (2030) plus Project (Phase I and Phase II) Conditions.

Impact TRANS-13f: Under 2030 cumulative conditions, buildout of the proposed Project (Phase I and Phase II) would increase the average intersection vehicle delay by more than two seconds during the AM peak hour at *Intersection #50 (Harrison Street / MacArthur Boulevard (Westbound) / Santa Clara Avenue) (2030)*, which would operate at an unacceptable LOS F during the AM peak hour under Cumulative (2030) without Project Conditions. (Significant)

Mitigation Measure TRANS-13f: Implement the following measures at the Harrison Street / MacArthur Boulevard (Westbound) / Santa Clara Avenue intersection:

- Optimize the traffic signal (to include determination of the allocation of green time for each intersection approach) for the AM peak hour in tune with the relative traffic volumes on those approaches.

-
- Coordinate the signal timing changes at this intersection with the adjacent intersections that are in the same signal coordination group.

To implement this measure, the Project Applicant shall submit the following to City of Oakland's Transportation Services Division for review and approval:

- Plans, Specifications, and Estimates (PS&E) to modify the intersection. All elements shall be designed to City standards in effect at the time of construction, and all new or upgraded signals should include these enhancements. All other facilities supporting vehicle travel and alternative modes through the intersection should be brought up to both City standards and ADA standards (according to Federal and State Access Board guidelines) at the time of construction. Current City Standards call for the elements listed below:
 - 2070L Type Controller
 - GPS communication (clock)
 - Accessible pedestrian crosswalks according to Federal and State Access Board guidelines
 - City Standard ADA wheelchair ramps
 - Full actuation (video detection, pedestrian push buttons, bicycle detection)
 - Accessible Pedestrian Signals, audible and tactile according to Federal Access Board guidelines
 - Countdown Pedestrian Signals
 - Fiber signal interconnect and communication to City Traffic Management Center for corridors identified in the City's ITS Master Plan for a maximum of 600 feet
 - Signal timing plans for the signals in the coordination group.

The project sponsor shall fund, prepare, and install the approved plans and improvements.

After implementation of this measure, conditions at this intersection (located within the Downtown area) would remain unacceptable, and the Project impact would not be mitigated. To completely mitigate the Project's impacts at this intersection would require substantial capacity improvements such as additional lanes on both the Harrison Street and MacArthur Boulevard (Westbound) approaches. Therefore, there are no feasible measures to completely mitigate the Project's impacts, and the Project impacts at this intersection are significant and unavoidable.

Significance after Implementation of Mitigation: Significant and Unavoidable.

If both Phase I and Phase II of the Project were built, this intersection would also be a significant and unavoidable impact under Cumulative (2030) plus Project (Phase I and Phase II) Conditions.

Roadway Impacts

Impact TRANS-14: Under 2030 cumulative traffic conditions, Phase I of the proposed Project would worsen level of service conditions on area roadway segments. (Significant at intersections described above under Impacts TRANS-13a to TRANS-13e)

Table 4 summarizes peak hour Level of Service for the study roadway segments under Cumulative (2030) plus South Tower Conditions, with the following roadway segments expected to operate at LOS F:

- Caltrans Facilities
 - #1: SR 260 (Posey/Webster Tubes) from Alameda city limits to I-880 (Northbound, AM and PM peak hours; and Southbound, PM peak hour)
 - #3: I-880 from Oak Street to 5th Avenue (Westbound, AM peak hour; and Eastbound PM peak hour)
 - #4: I-980 from 27th Street to 29th Street (Southbound, AM peak hour)
- Non-Caltrans Facilities
 - #9: Grand Avenue from Harrison Street to El Embarcadero (Westbound, AM peak hour; and Eastbound, PM peak hour)
 - #10: Harrison Street/Oakland Avenue between I-580 and 27th Street (Southbound, AM peak hour; and Northbound, PM peak hour)
 - #10: Harrison Street / Oakland Avenue from 27th Street to Grand Avenue (Southbound, AM peak hour; and Northbound, PM peak hour)

**TABLE 4

Bold indicates significant impact.

SOURCE: AECOM, 2010.

The South Tower would not result in a significant impact on the following segments because the addition of South Tower-generated traffic would not cause an increase in v/c ratio greater than the three percent threshold of significance:

- #1: SR 260 (Posey / Webster Tubes) from Alameda city limits to I-880
- #4: I-980 from 27th Street to 29th Street

The Project's potential impacts on each of the remaining segments are discussed below:

Impact TRANS-14a: Under 2030 cumulative traffic conditions, Phase I of the proposed Project would degrade the roadway segment level of service from an acceptable LOS E to an unacceptable LOS F during both peak hours on Segment #3 (I-880 from Oak Street to 5th Avenue) (2030). (Significant)

It should also be noted that, in each case, while the South Tower would cause the segment to operate to LOS F (because the traffic volumes would exceed the 8,000 vehicles hourly capacity), the increase in v/c ratio would be only one percent, and rounded to the hundredths place (per standard practice), the v/c ratio is 1.00, which is LOS E.

Mitigation Measure TRANS-14a: There are no feasible measures to mitigate the South Tower impact, given the existing alignment and constraints due to lack of right-of-way for both the roadway on the west end of the channel and possibly for support columns above the Union Pacific right-of-way. The segment of I-880 from Oak Street to 5th Avenue consists of two four-lane aerial structures, with the segment immediately west of Lake Merritt Channel bordered on the north by the Laney College parking lot and on the south by industrial uses. The aerial structure continues east of the channel, crossing over the existing Union Pacific railroad right-of-way. Increasing capacity on the freeway would likely require increasing the number of travel lanes. Also, any proposed mitigation measure would also require Caltrans project approval. Therefore, the South Tower impacts on this roadway segment are significant and unavoidable.

Significance after Implementation of Mitigation: Significant and Unavoidable.

If both Phase I and Phase II of the Project were built, this roadway segment would also be a significant and unavoidable impact under Cumulative (2030) plus Project (Phase I and Phase II) Conditions.

Impact TRANS-14b: Under 2030 cumulative traffic conditions, Phase I of the proposed Project would degrade the roadway segment level of service from an acceptable LOS E to an unacceptable LOS F during the AM peak hour and increase the v/c ratio by more than three percent during the PM peak hour on Segment #9 (Grand Avenue from Harrison Street to El Embarcadero) (2030), which would operate at an unacceptable LOS F during the PM peak hour under Cumulative (2030) without Project Conditions. (Significant)

Mitigation Measure TRANS-14b: Implement Mitigation Measure TRANS-2a along Grand Avenue:

-
- Optimize traffic signals (i.e., adjust the allocation of green time for each intersection approach) at intersections along Grand Avenue (i.e., Harrison Street, Bay Place, Park View Terrace / Bellevue Avenue, Perkins Street, Staten Avenue, Euclid Avenue, and El Embarcadero) for the AM and PM peak hours.
 - Coordinate the signal timing at the intersections in the road segment.

To implement this measure, the Project Applicant shall submit the following to TSD for review and approval:

- PS&E to modify the intersections. All elements shall be designed to City standards in effect at the time of construction, and all new or upgraded signals should include these enhancements. All other facilities supporting vehicle travel and alternative modes through the intersections should be brought up to

After implementation of this measure, conditions would remain at an unacceptable LOS, and the South Tower impact would not be mitigated. This measure alone would not be sufficient to completely mitigate the South Tower impacts on this segment, but as discussed for Impact TRANS-2a, there are no feasible mitigation measures to completely mitigate the South Tower impacts. Therefore, the South Tower impacts on this roadway segment are significant and unavoidable.

Significance after Implementation of Mitigation: Significant and Unavoidable.

If both Phase I and Phase II of the Project were built, this roadway segment would also be a significant and unavoidable impact under Cumulative (2030) plus Project (Phase I and Phase II) Conditions.

Impact TRANS-14c: Under 2030 cumulative traffic conditions, buildout of the proposed Project (Phase I and Phase II) would degrade the level of service from an acceptable LOS E to an unacceptable LOS F during the AM peak hour and increase the v/c ratio by more than three percent during the PM peak hour on *Segment #10 (Harrison Street / Oakland Avenue from I-580 to 27th Street)* (2030), which would operate at an unacceptable LOS F during the PM peak hour under Cumulative (2030) without Project Conditions. (Significant)

Mitigation Measure TRANS-14c: To completely mitigate the South Tower's impacts would require substantial capacity improvements such as an additional travel lane on Harrison Street / Oakland Avenue in the northbound direction, which may conflict with objectives of Harrison Street / Oakland Avenue Community Transportation Plan currently in progress and require removal of bike lanes or substantial amounts of on-street parking. Therefore, there are no feasible measures to completely mitigate the impacts of the South Tower, and the impacts on this roadway segment are significant and unavoidable.

Significance after Implementation of Mitigation: Significant and Unavoidable.

If both Phase I and Phase II of the Project were built, this roadway segment would also be a significant and unavoidable impact under Cumulative (2030) plus Project (Phase I and Phase II) Conditions.

Bicycle Impacts

Table 5 specifies the City of Oakland Municipal Code requirements for the provision of short- and long-term bicycle parking facilities, as well as shower and locker facilities, for the South Tower. The 136 long-term bicycle spaces should be secure and serve office workers who may leave their bicycles at the same location all day or overnight, and should be provided in the form of bicycle lockers or bicycle cages.

**TABLE 5
SOUTH TOWER BICYCLE FACILITY REQUIREMENTS**

| Facility / Land Use | Amount (KSF) ^a | Municipal Code Provision | Facility Requirement |
|------------------------------------|---------------------------|---|--|
| Bicycle Parking | | | |
| Office | 552 | 1 long-term space per 10 KSF
1 short-term space per 20 KSF | 55 long-term spaces
28 short-term spaces |
| Retail | 27 | 1 long-term space per 12 KSF
1 short-term space per 5 KSF | 2 long-term spaces
5 short-term spaces |
| Total | | | 57 long-term spaces
33 short-term spaces |
| Bicycle Showers and Lockers | | | |
| Office | 552 | 2 showers per gender, plus one shower per gender for each 150 KSF above 150 KSF | 4 showers per gender (8 total) |
| | | 4 lockers per shower | 32 lockers |
| Retail | 27 | No locker or shower requirements (less than 150 KSF) | -- |
| Total | | | 4 showers per gender (8 total)
32 lockers |

^a KSF = 1,000 sq. ft.

SOURCE: AECOM, 2010.

The 33 short-term bicycle racks would accommodate visitors who leave their bikes for a reasonably short period of time and should be provided in areas that provide shelter and, ideally, a high level of passive security from surrounding pedestrians. Other visible security measures such as security cameras may also be considered.

South Tower site plans do not include provisions to accommodate bicycle parking. City of Oakland's SCAs include SCA TRANS-2, which requires that prior to the issuance of first certificate of occupancy, the applicant shall submit for review and approval of the Planning and Zoning Division, plans that show bicycle storage and parking facilities to accommodate 33 short-term bicycle parking spaces onsite or on public sidewalk, and 57 long-term bicycle parking spaces.

Although not required to mitigate a significant impact, Class 2 bicycle facilities (bicycle lane) should be considered on Franklin Street and Webster Street to improve bicycle conditions in the immediate vicinity of the South Tower. As discussed in the Existing Bicycle Conditions section, the section of Franklin Street and Webster Street between 8th Street and Broadway is proposed for Class 2 bicycle facilities (bicycle lanes) and Class 3 (bicycle route). In order to encourage use of alternative modes of travel such as bicycling and provide greater safety for bicyclists; it is recommended that these sections of the bikeway network be completed. **Table 6** presents the

TABLE 6
CUMULATIVE (2030) WITHOUT AND WITH SOUTH TOWER INTERSECTION LEVELS OF SERVICE –
WITH FRANKLIN STREET AND WEBSTER STREET BIKE LANES

^a The LOS and delay for signalized intersections represent the average delay for all movements.

SOURCE: AECOM, 2010.

LOS results (without and with the South Tower) at four study intersections that would have its vehicle approach lanes modified to accommodate the proposed bike lane. More specifically, the proposed bike lanes would result in the following changes to the existing vehicle approach lanes:

SB Webster at 21st: Existing = 1 Shared Left-Thru, 1-Thru and 1-Shared Thru-Right
With Bike Lane=1-Shared Left-Thru and 1-Shared Thru-Right

NB Franklin at 21st: Existing = 1 Shared Left-Thru, 1-Thru and 1-Shared Thru-Right
With Bike Lane=1-Shared Left-Thru and 1-Shared Thru-Right

NB Franklin at 20th: Existing = 1 Shared Left-Thru, 2-Thru and 1-Right Turn Only
With Bike Lane=1-Shared Left-Thru, 1-Thru and 1-Right Turn Only

SB Webster at 20th: Existing = 1 Shared Left-Thru, 1-Thru and 1-Shared Thru-Right
With Bike Lane=1-Shared Left-Thru, 1-Thru and 1-Right Turn Only

Under Cumulative Conditions with the bike lanes on Franklin Street and Webster Street, the South Tower is not expected to have a significant impact on the four study intersections. In most cases, the South Tower is expected to add volume to non-critical movements, thus reducing the average delay at the intersections.

AC Transit Travel Time

Travel time along the following corridors was evaluated in order to determine the impacts of Project-generated traffic on the operations of key AC Transit trunk lines in Downtown Oakland:

1. 11th Street (eastbound) from Brush Street to Oak Street
2. 12th Street (westbound) from Oak Street to Brush Street
3. 20th Street (eastbound) from Telegraph Avenue to Harrison Street
4. 20th Street (westbound) from Harrison Street to Telegraph Avenue
5. Broadway (southbound) from 27th Street to 20th Street
6. Broadway (southbound) from 20th Street to 11th Street
7. Broadway (northbound) from 11th Street to 20th Street
8. Broadway (northbound) from 20th Street to 27th Street
9. Grand Avenue between MacArthur Boulevard and Harrison Street – (westbound AM and eastbound PM)
10. Harrison Street between MacArthur Boulevard and Grand Avenue (southbound AM and northbound PM)
11. Telegraph Avenue between 20th Street and 27th Street (southbound AM and northbound PM)

Corridors #1 through #8 were analyzed in both directions during both the AM and PM peak hours. Corridors #9, #10, and #11 were analyzed for only one direction during each peak hour, as traffic on these segments is highly directional. For the previous AC Transit Travel Time analysis, Phase I of the Project represented build-out of only the North Tower. The following analysis represents conditions with build-out of only the South Tower

Table 7 summarizes the results of the travel time analysis for the AM and PM peak hours. Observations of corridor travel times were taken for Existing Conditions and travel time differentials obtained from the Synchro networks used in the intersection LOS analysis. A minimum of three field runs were conducted in each direction for each corridor in September 2008.

It should be noted that the travel times presented here only represent the time it takes automobiles to travel the length of the corridor. Obtaining a travel time estimate for transit vehicles traveling through corridors can be difficult considering that the travel time for transit vehicles is much

more variable than that for automobiles. This variability is due to a wide variety of factors, but primarily involves schedule adherence and on-time performance. A transit vehicle that is already behind schedule can quickly get further behind schedule due to accumulating passenger demand at transit stops, resulting in longer than usual dwell times to allow passengers to board and alight. In addition, because transit vehicles must follow the same route, there is less flexibility than with automobiles in events such as accidents or unexpected congestion, increasing delays further. Given these considerations, the values in Table 8 should be viewed as the incremental increase in transit travel time compared to Existing Conditions.

SOURCE: AECOM, 2010.

As shown in Table 8, the South Tower would increase peak hour travel times along most corridors, mostly as a result of increases in intersection average delay. Some corridors would see average travel time decrease slightly between existing and future-year scenarios and between baseline and South Tower scenarios, primarily as a result of geometry changes or better-performing movements at intersections. Travel time on westbound 20th Street, for example, is lower under Cumulative (2030) without Project Conditions than under Existing Conditions, partially as a result of reduced delays due to Measure DD modifications at this intersection.

A comparison between Existing Conditions and Existing plus South Tower Conditions, indicate that the South Tower would increase travel time the most on the following transit corridors:

- #3: 20th Street EB (from Telegraph Avenue to Harrison Street)- 20 seconds in the AM and 28 seconds in the PM;
- #10: Harrison Street NB (from Grand Avenue to Perry Place) –51 seconds in the PM.

Under Cumulative (2030) plus South Tower Conditions, the South Tower (when compared to Cumulative without Project Conditions) would cause an increase in corridor travel time of nine seconds (=24-15) along westbound Grand Avenue (from MacArthur Boulevard to Harrison Street) in the AM peak hour and an increase of 67 seconds (=146-79) in the PM peak hour along northbound Harrison Street (from Grand Avenue to Perry Place). Other corridors such as Broadway would also experience substantial increases in travel time under Cumulative Conditions, but the South Tower contribution to these increases would be minimal.

Given that Grand Avenue and Harrison Street are major corridors with significant vehicle traffic traveling to and from I-580 ramps, transit vehicles on these routes already experience some delay during the peak periods and would continue to do so in Cumulative (2030) with South Tower Conditions.

Mitigation: None required.

Planning-Related Non-CEQA Issues

The following section discusses transportation-related planning issues that do not constitute physical environmental impacts under CEQA, but that are evaluated to inform decision makers and the public about these issues.

Transit

Based on the 30 percent transit mode share assumed for the trip generation analysis, the South Tower would generate about 256 transit trips in the weekday AM peak hour and 243 transit trips in the weekday PM peak hour. Given that the Project would consist primarily of office space, these trips would almost exclusively be inbound during the AM peak hour and outbound during the PM peak hour. The expected distribution of transit trips was developed based on the trip distributions derived from the ACCMA Travel Demand Model.

For origins and destinations with both BART and AC Transit service, the split of Project-generated new transit riders on BART and AC Transit was based on a transit mode split of 7 percent AC Transit and 23 percent BART (for a total transit share of 30 percent) presented in the *Downtown Transportation and Parking Plan* (2003) for the Old Oakland / Metro Center / County Center Downtown subareas. The results of this analysis are summarized in **Table 8**.

TABLE 8
SOUTH TOWER WEEKDAY PEAK-HOUR TRANSIT TRIPS

SOURCE: AECOM, 2010.

AC Transit Loading

As shown in Table 6, the most substantial increase in transit ridership as a result of the South Tower would occur on the NL route, which would carry about 12 new riders in both the AM and PM peak hours. With 15-minute headways, this increase in ridership is equivalent to about three new riders per bus. The NL is has substantial capacity to accommodate these additional riders.

The South Tower would also cause increases of 8 to 12 passengers in the AM and PM peak hours to and from other origins and destinations, but these areas are served by multiple AC Transit bus lines. The South Tower transit ridership would likely only result in a maximum increase of two passengers per bus on these lines.

Given this increase in AC Transit ridership, it is not expected that the South Tower would increase the average ridership on AC Transit lines by three percent at bus stops where the average load factor in place would exceed 125 percent over a peak 30-minute period.

BART Loading

As shown in Table 6, the most substantial increase in transit ridership as a result of the South Tower would occur on the San Francisco and Fremont corridors of the BART network, which would see increases of about 50 passengers each in both the AM and PM peak hours.

Based on BART fleet statistics, the maximum capacity of a BART car was assumed to be 150 passengers, with an average of 68 to 72 seats in each car. Therefore, cars would have only standing room available at about 45 to 48 percent capacity utilization.

Under Existing plus South Tower Conditions, ridership would increase by about 12 passengers per train for these lines during the peak hours, or about two passengers per car. This is equivalent to a one percent increase in capacity utilization for these lines, bringing maximum capacity utilization on Fremont – Richmond trains in the AM peak hour to 83 percent and on Richmond – Fremont trains in the PM peak hour to 81 percent. However, the South Tower would not cause BART passenger volumes to exceed the standing capacity of trains.

Trains on other lines would see similar increases, but because they currently operate at well under 100 percent capacity utilization, these trains have capacity to accommodate additional South Tower-generated riders without exceeding standing capacity.

BART Faregate Queuing

Based on the estimates of BART ridership in Table 6, South Tower would add about 20 passengers during the peak queuing scenario (13 passengers from the Fremont – Richmond train and 7 passengers from the SFO – Pittsburg / Bay Point train). Based on a BART faregate capacity of 25 passengers per minute and assuming that these additional South Tower-generated riders all arrive at the faregates at the same time, the South Tower would theoretically increase the maximum faregate queues by 7 passengers to 13 passengers in length. It is likely that the South Tower would increase maximum queue delay by ten seconds at the most, but still keeping the maximum queue delay well under the one minute performance standard of the City of Oakland.

Intersection and Roadway Segment Operations with BRT

The AC Transit East Bay Bus Rapid Transit (BRT) Project is in the planning and are neither fully funded nor approved. Although only funded and approved projects are typically considered for inclusion in impact analyses, the following describes the result of separate supplementary BRT related traffic analyses.

As described on page IV.L-36, the proposed BRT improvements would generally require the removal of one through lane in each direction along Telegraph Avenue, narrowing the roadway to one vehicular lane in each direction. BRT vehicles would run in a protected median, with left turn pockets for autos provided at key intersections. Along 11th and 12th streets in Downtown Oakland, the BRT service would operate in a side-running configuration, removing one lane of through traffic and eliminating some parking to allow for bulbouts at stations. The LOS at eight study intersections (**Table 9**) and the roadway segment (**Table 10**) closest to the proposed BRT were calculated for Cumulative Conditions. Under Cumulative Conditions with the BRT, the South Tower is expected to increase the V/C ratio by 0.10 (from 1.71 to 1.81) at Telegraph Avenue/27th Street, thus exceeding the three percent threshold of significance. Since it is not feasible to add lane capacity at this intersection and still accommodate the BRT, this impact will be Significant and Unavoidable. The proposed removal of one lane in each direction on Telegraph Avenue to accommodate the BRT reduces the capacity of each direction in half (from

1,800 vehicles/hour to 900) thus causing the northbound direction to operate at LOS F during the PM peak. In the northbound direction, the South Tower increases the V/C ratio by 0.01 (from 1.20 to 1.21), which is below the three percent threshold of significance.

Intersection Queuing Analysis

Queuing analysis was carried out for all of the “plus South Tower” scenarios using the Synchro software. Signalized intersections operating at unacceptable conditions as shown in Table IV.L-10, Table IV.L-12, Table IV.L-14, and Table IV.L-16 were selected for evaluation as the South Tower is expected to have its largest effect on 95th percentile queues at these intersections. A 95th percentile queue of 100 feet means that 95 percent of the time, the queue is expected to be

100 feet or less. The 95th percentile queue is used for analysis, because it is standard practice to design a storage pocket to accommodate expected peak traffic demand 95 percent of the time. In all cases, the storage capacity (rounded to the nearest 25 feet) is taken as the distance to the nearest intersection, major driveway, or pedestrian crossing. **Table 11** and **Table 12** summarize the queuing analysis for Existing plus South Tower Conditions and Cumulative plus South Tower Conditions, respectively.

Identified below are instances where the South Tower trips would add 25 or more feet to the baseline (without South Tower) 95th percentile queue (if the baseline 95th percentile queue was already over the available storage length), or where South Tower trips would extend the queue over the available storage length. The findings are summarized below.

Existing plus South Tower Conditions

- Intersection #2: Oakland Avenue / Perry Place / I-580 EB Ramps (PM) – Oakland Avenue NER;
- Intersection #3: Harrison Street / 27th Street / 24th Street (PM) – Harrison Street NBTR;
- Intersection #42: Jackson Street / 6th Street / I-880 NB On-Ramp (AM)-Jackson Street NBL and SBR;
- Intersection #45: Grand Avenue / El Embarcadero (PM) – Grand Avenue NET; and,
- Intersection #47: Grand Avenue / MacArthur Boulevard (PM) – Grand Avenue NER.

Cumulative (2030) plus South Tower Conditions

- Intersection #2: Oakland Avenue / Perry Place / I-580 EB Ramps (AM / PM) – Oakland Avenue NER;
- Intersection #3: Harrison Street / 27th Street / 24th Street (AM / PM) – Harrison Street SBLTR (AM) and NBTR (PM);
- Intersection #5: Telegraph Avenue / 27th Street (PM) – Telegraph Avenue NBL and SBLTR, and 27th Street WBT;
- Intersection #12: Harrison Street / Grand Avenue (AM / PM) – Harrison Street NBTR (PM) and SBTR (AM / PM), and Grand Avenue WBL (AM);
- Intersection #24: Harrison Street / 20th Street / Kaiser Center Access Road (PM) – Harrison Street NBLTR;
- Intersection #32: Oak Street / 14th Street (PM)-14th Street EBLT;
- Intersection #40: Oak Street / 7th Street (PM)-Oak Street NBTR;
- Intersection #42: Jackson Street / 6th Street / I-880 NB On-Ramp (AM / PM)-Jackson Street NBL and SBR (AM / PM), and 6th Street WBT (AM);
- Intersection #44: Oak Street / 5th Street / I-880 SB On-Ramp (AM / PM)-Oak Street NBTR;
- Intersection #45: Grand Avenue / El Embarcadero (PM) – Grand Avenue NET;
- Intersection #47: Grand Avenue / MacArthur Boulevard (AM / PM) – MacArthur Boulevard SELTR (AM / PM); and Grand Avenue SWLT (AM / PM) and NER (PM);
- Intersection #48: Lakeshore Avenue / MacArthur Boulevard / I-580 EB On-Ramp (AM / PM) – MacArthur Boulevard EBT (PM) and Lakeshore NETR and SWL (AM / PM);
- Intersection #49: Oakland Avenue / MacArthur Boulevard (WB) / Santa Clara Ave. / I-580 WB Off-Ramp (AM) – Oakland Avenue NET and I-580 WB Off-Ramp NWTR;
- Intersection #50: Harrison Street / MacArthur Boulevard (WB) / Santa Clara Avenue (AM) – Harrison Street SWT and MacArthur Boulevard NWLT.

It should be noted, however, that most of these locations have already been proposed for mitigation measures as a result of intersection LOS impacts. These measures, which include optimization of signal timing and phasing and upgrading of traffic signal hardware, would mitigate some of the Project's intersection LOS impacts at these locations, and would generally improve 95th percentile queues. In cases where the proposed mitigation measures would not completely mitigate the Project's intersection LOS impacts, further improvements to reduce 95th percentile queues would generally be infeasible, as these are typically geometrically-constrained intersections and may be locations where further improvements would conflict with policies for other modes or even with objectives of the Harrison Street / Oakland Avenue CTP.

South Tower Loading Docks and Parking Demand

Loading Docks

Three berths would be located in a single dock on the east side of the Project site, with access from the Access Road running through the Kaiser Center block. These berths would serve the South Tower and are shown in Figure IV.L-11 in the DEIR.

Impact TRANS-9 (as identified in the DEIR for Project Buildout): The Project would create potential conflict between loading dock operations and vehicular access to and from the Kaiser Center Garage and would present a potential safety hazard for pedestrians, bicyclists, and other drivers. (Significant)

The following mitigation measure (shall be applied to South Tower Phase 1 Build only).

Mitigation Measure TRANS-9 (as identified in the DEIR for Project Buildout):

Prohibit delivery and service vehicles from accessing the loading docks during the AM and PM peak periods in order to minimize the impact of loading operations on access for the Kaiser Center Garage. The section of the Access Road from Harrison Street / 20th Street to the garage entrance should be restricted to delivery and service vehicles during off-peak hours. During off-peak periods, the Access Road approach onto Harrison Street / 20th Street should be separated off by bollards or other removable barriers to prevent passenger vehicles from crossing the site and expand pedestrian space in this immediate area. Adequate additional site management staff should be made available to direct loading maneuvers to improve the safety of pedestrians, bicyclists, and drivers during deliveries into and out of this dock. Concurrent with the submittal of a Final Development Plan, the Project Applicant shall prepare and submit a loading dock plan and operational analysis which demonstrates there are no conflicts with vehicular, pedestrian, and bicycle access to or adjacent to the site for City review and approval. The Project Applicant shall implement the approved plan.

Potential Additional Recommended Conditions for Pedestrians

Site observations concluded that existing pedestrian facilities generally are insufficient. Given those concerns, and the fact that the Project will add a significant number of new pedestrian trips, the following “Recommended Conditions” should be considered to improve safety operations of pedestrian facilities in the immediate vicinity of the Project and are consistent with the City’s Pedestrian Master Plan. These Recommendations are the same as those identified in this DEIR for Project Buildout. Although not required by CEQA, these Recommended Conditions are recommended herein by City Staff to be included as Project specific conditions of approval. They are not necessary to address or mitigate any environmental impacts of the Project. .

Recommendation TRANS-1: Increase sidewalk capacity on the north side of 20th Street between Broadway and Harrison Street.

In order to improve pedestrian flow, it is recommended that the sidewalk capacity along the north side of 20th Street between Broadway and Harrison Street be increased as follows:

- **Between Broadway and Franklin Street, remove parking and widen the sidewalk.** Currently, a limited amount of metered on-street parking is provided just east of the BART station entrance (three spaces on the north side of 20th Street and two spaces on the south side of 20th Street). The section on the north side directly east of the entrance is used as a de facto “kiss-and-ride” zone in the mornings and pickup zone in the afternoon and evenings. Several employee shuttles from the office buildings at 180 Grand, 155 Grand and 1 Kaiser Plaza also use this curb space to load

and offload passengers. However, circulation space is limited because the sidewalk begins to narrow 30 feet east of the entrance. This section of curb also includes an exit driveway for the existing building on the northeast corner of the intersection of Franklin Street / 20th Street.

In the AM peak periods, pedestrian traffic exiting the BART station via the escalator (located on the north side of the station entrance) conflicts with pedestrian traffic entering the station attempting to access the stairwell (located on the south side of the station entrance). Employees attempting to board the special shuttles also cross against opposing pedestrian traffic in order to reach the shuttle boarding area.

By removing parking and widening the sidewalk, circulation space directly east of the entrance could be increased.

Once the three parking spaces on the north side of 20th Street are removed, the existing bus stop serving AC Transit Lines 11, 59, 59A, and 805 would then be moved out to the new curb line, resulting in a larger unobstructed width on the main part of the sidewalk. The extended curb could align with the existing “bulbout” for the BART station entrance and 20th Street restriped to remove the misalignment in the pavement markings. A bulbout could also be provided at the northwest corner of Franklin Street / 20th Street in the east-west direction. This would not require removal of any parking as that section of curb is already marked red, but would significantly increase queuing space for pedestrians waiting to cross.

Removal of three spaces would have a negligible impact on overall parking conditions in the area. It is important to note that the schematic is only a conceptual illustration, and implementation of any or all of the improvements would require further analysis and design.

It should also be noted that there are several AC Transit stops in close proximity along westbound 20th Street between Telegraph Avenue and Harrison Street:

- North side of 20th Street between Telegraph Avenue and Broadway (three stops occupying the full length of block);
- Northwest corner of Franklin Street / 20th Street; and,
- Northeast corner of Webster Street / 20th Street.

While most AC transit services do not use all three stops, some consolidation of stops could also be considered to streamline service, reduce transit vehicle travel times, and improve passenger connections.

- **Between Franklin Street and Webster Street, widen the sidewalk.**

This section of 20th Street is proposed for Class 2 bicycle facilities (bicycle lanes), which would require removal of the exclusive westbound right-turn lane. Additional space obtained as part of those improvements could be set aside for sidewalk widening along the north side of 20th Street, which has an extremely limited unobstructed width due to building frontage.

If the westbound right-turn lane were removed, the intersection of Franklin Street / 20th Street would still operate at LOS B (14.0 seconds of intersection average delay) during the weekday AM peak hour and LOS B (14.7 seconds of intersection average

delay during the weekday PM peak hour under Cumulative (2030) plus Project (Phase I and Phase II) Conditions. Without removal of the westbound right-turn lane, the intersection would operate at LOS B under both peak hours, with intersection average delay at 14.1 seconds during the weekday AM peak hour and 14.5 seconds during the weekday PM peak hour. Therefore, removal of the westbound right-turn lane would produce a negligible change in intersection operations and would not result in secondary impacts if implemented.

The northeast corner of Franklin Street / 20th Street could be redesigned so as to reduce the curb radius, shortening crossing distances for pedestrians and encouraging drivers to take their turns slower. A bulbout could also be provided at this corner to further reduce crossing distances.

- **Between Webster Street and Harrison Street, redesign the Project frontage to be pedestrian-friendly.** The portion of 20th Street abutting the site is split into two narrow paths as a result of landscaping and a slight grade from the edge of the existing buildings to the curb. The path closest to the curb is extremely narrow and is partially restricted by the AC Transit bus stop east of the intersection of Webster Street / 20th Street. The path closer to the existing building is restricted by outdoor cafe seating.

The sidewalk could be redesigned to reduce or eliminate the grade difference and better position the landscaping so as to buffer the sidewalk from the roadway as opposed to divide the sidewalk in two. Given the wide curb lane, the sidewalk closest to the intersection with Webster Street could be widened in a similar fashion to the section of 20th Street between Broadway and Franklin Street. The existing bus stop would be moved out to the new curb line. This may, however, restrict some through capacity along westbound 20th Street, as vehicles could queue up behind stopped transit vehicles, unable to pass around them.

Bulbouts could be provided at the northwest and northeast corners of this intersection in the east-west direction, shortening crossing distances and increasing queuing space on the major pedestrian route to and from BART.

Recommendation TRANS-2: Reduce cycle times of signals at the intersections of Franklin Street / 20th Street and Webster Street / 20th Street.

Due to long cycle lengths, one-way traffic, and relatively low traffic volumes, there is a high occurrence of pedestrians on the north side of 20th Street crossing Franklin Street and Webster Street illegally. Reducing the cycle length of these signals would shorten wait times for pedestrians attempting to cross, improving safety for all road users, including drivers, bicyclists, and pedestrians. Currently, these intersections operate with 80-second cycle lengths, but these could be reduced to 60- or 70-second cycle lengths to reduce waiting times for pedestrians attempting to cross.

Parking Demand Evaluation

This section evaluates if the South Tower estimated parking demand would be met by the existing parking supply within a reasonable walking distance (five minutes or 900 feet) of the Project site.

Table 13 summarizes vehicle parking code requirements and estimated parking demand for the South Tower. Because the proposed retail space is assumed to be a one-to-one replacement of existing retail space at the Project site, the proposed retail space is omitted from the code requirement and demand calculations.

The South Tower would construct 467 new parking spaces, but would not involve demolition of any existing parking spaces in the Kaiser Center Garage, resulting in a net new increase of 467 parking spaces. After completion of the South Tower, the Kaiser Center Garage would have a capacity of 1,807 spaces and be operated as a single garage shared between the existing Kaiser Center tower and the South tower. For the purposes of comparing parking supply and demand, however, the South tower is assumed to have an on-site parking supply of 467 spaces.

**TABLE 13
PARKING CODE REQUIREMENTS AND PARKING DEMAND FOR THE SOUTH TOWER**

| Land Use ^a | Size (KSF) ^b | Code Requirement | Parking Demand | | |
|---------------------------|-------------------------|------------------|----------------|--|-----------------------|
| | | | ITE | Downtown Transportation and Parking Plan | Spaces Proposed (Net) |
| Office (South Tower Only) | 552 | 0 | 1,325 | 773 | 467 |

^a For office use (Land Use 701 – Office Building, Urban):
Average Peak Period Parking Demand: 2.40 vehicles per 1,000 sq. ft. GFA

^b KSF = 1,000 sq. ft.

SOURCE: City of Oakland *Municipal Code* 17.116.080; Institute of Transportation Engineers (ITE), *Parking Generation* (3rd Edition), 2003; AECOM, 2010.

According to the City of Oakland Municipal Code, the Project is not required to provide any off-street parking because of its location in a C-55 / S-17 zoning district. Therefore, no additional parking is being proposed with the South Tower only option.

According to national Institute of Transportation Engineers (ITE) statistics, the South Tower would generate a parking demand of approximately 1,325 spaces. The available existing capacity within the Kaiser Center Garage and in the surrounding area would be about 913 spaces:

- 419 spaces in average existing capacity available at the Kaiser Center Garage, based on occupancy data as of July 2010 (Table IV.L-7); and,
- 494 spaces in average existing capacity available at off-street parking facilities in the vicinity of the Project, based on occupancy surveys as of October 2008 (Table IV.L-7, all facilities other than the Kaiser Center Garage).

Based on this available capacity and ITE parking demand estimates, the South Tower may result in a parking shortfall of about 412 spaces.

It should be noted, however, that the estimated parking demand rate of 2.4 vehicles per 1,000 square feet represents an average for suburban locations where private automobiles are the primary mode

of travel, and is therefore not entirely applicable for areas with comprehensive transit service such as Downtown Oakland. The *Downtown Transportation and Parking Plan*, compiled by Dowling Associates for the City of Oakland Redevelopment Agency and the Community and Economic Development Agency (CEDA) in October 2003, recommended off-street parking ratios of 1.4 vehicles per 1,000 square feet for locations in Downtown outside of the City Center area, within two blocks of BART. Based on these calculations, the South Tower would generate a parking demand of about 773 spaces, which could be met by available off-street parking capacity in the surrounding area.

Alternative Measure DD Analysis for South Tower

The following is a summary of the Alternative Measure DD analysis for both Cumulative (2030) conditions without and with the South Tower. **Figure 3** summarizes the traffic volumes used for the LOS analysis presented in **Table 14**.

TABLE 14
CUMULATIVE (2030) WITHOUT AND WITH SOUTH TOWER
INTERSECTION LEVELS OF SERVICE – ALTERNATIVE MEASURE DD

| No. | Intersection | Traffic Control | Cumulative (2030) without Project Conditions (Alternative Measure DD) | | | | Cumulative (2030) plus South Tower Conditions (Alternative Measure DD) | | | |
|-----------------|---|-----------------|---|--------------------|--------------|--------------------|--|--------------------|--------------|--------------------|
| | | | AM Peak Hour | | PM Peak Hour | | AM Peak Hour | | PM Peak Hour | |
| | | | LOS | Delay ^a | LOS | Delay ^a | LOS | Delay ^a | LOS | Delay ^a |
| Within Downtown | | | | | | | | | | |
| 24 | Harrison St. / 20th St. / Kaiser Ctr. Access Road | Signal | D | 39.8 | F | 107.4 | E | 69.0 | F | >120 |
| 25 | Kaiser Ctr. Access Rd. / 20th Street ^b | SSSC | B | 10.5 | B | 10.1 | -- | -- | -- | -- |

Bold indicates significant impact.

^a The LOS and delay for one-way stop controlled intersections represent the worst movement or approach. The LOS and delay for signalized intersections represent the average delay for all movements.

^b The Project would combine this intersection with Intersection #24.

SOURCE: AECOM, 2010.

As shown in the table, the following intersection would operate at unacceptable conditions under Cumulative (2030) plus South Tower Conditions (Alternative Measure DD):

- Within Downtown (LOS F)
 - LOS F - Intersection #24: Harrison Street / 20th Street / Kaiser Center Access Road (PM)

**Cumulative (2030) without
South Tower Conditions**

**Cumulative (2030) plus
South Tower Conditions**

Potential impacts at the above intersections due to the Project are discussed below.

Impact ALT DD TRANS-4 Intersection #24: Harrison Street / 20th Street / Kaiser Center Access Road (PM). The intersection of Harrison Street / 20th Street / Kaiser Center Access Road would operate at LOS F in the PM peak hour under both Cumulative (2030) without Project Conditions (Alternative Measure DD) and Cumulative (2030) plus South Tower Conditions (Alternative Measure DD). The intersection is located within the Downtown area.

Because the Project would cause an increase in average intersection delay greater than the two-second threshold of significance, the Project would result in a significant impact at this intersection.

Mitigation Measure ALT DD TRANS-4:

1. The Project applicant shall add an additional lane and reconfigure the northbound Harrison Street approach as a shared left-through lane (to westbound 20th Street and Kaiser Center Access Road) and two exclusive right-turn lanes (one lane to northbound Harrison Street, the other to northbound Harrison Street and eastbound 20th Street / Lakeside Drive). This would require curb setback of about 10 feet and a corresponding reduction in park space and removal of up to five on-street parking spaces along the west side of Snow Park.

In addition, the left turns from the Kaiser Center Access Road to eastbound 20th Street / Lakeside Drive would need to be prohibited in order to allow the northbound movement along Harrison Street to run concurrently with the Access Road phase.

2. Implement Mitigation Measure TRANS-13e.
3. Consider implementation of Recommendation TRANS 6:

Installation of a signalized mid-block pedestrian crossing across Harrison Street between 20th Street and 21st Street under the Alternative Measure DD Configuration would require signal coordination with adjacent traffic signals at Harrison Street / 21st Street, Harrison Street / 20th Street / Kaiser Center Access Road, and other signals in the same signal coordination group. Due to the coordination, the pedestrian phase could be timed to coincide with periods of low arriving traffic flow from upstream intersections such that no additional intersection delay would be created. Instead, the signalized mid-block crossing would potentially improve operations along this corridor by “metering” traffic entering the ultimate bottleneck intersections at Harrison Street / Grand Avenue and Harrison Street / 20th Street / Kaiser Center Access Road. As a result, the crossing itself would not result in secondary impacts to other modes.

To implement these measures, the Project Applicant shall submit to City of Oakland’s Transportation Services Division for review and approval a PS&E to modify the intersection. All elements shall be designed to City standards in effect at the time of construction, and all new or upgraded signals should include these enhancements. All other facilities supporting vehicle travel and alternative modes through the intersection should be

brought up to both City standards and ADA standards (according to Federal and State Access Board guidelines) at the time of construction.

The Project Applicant shall fund, prepare, and install the approved plans and improvements.

Significance after Implementation of Mitigation: If additional mitigation measures for the Project are determined feasible by the City, then the impact at this location would be Less than Significant. Otherwise, as described above, the Project impacts at this location would be Significant and Unavoidable.

After implementation of the proposed mitigation measure, the intersection would still operate at LOS D in the PM peak hour under Cumulative (2030) plus Project (Phase I) Conditions (Alternative Measure DD), which is a Less than Significant impact. However, measures that reduce the land area of Snow Park or eliminate parking spaces in this block may not be acceptable to the City, as they also result in secondary impacts on pedestrians. Therefore, signal optimization may be the only other feasible mitigation measure; however, this does not completely mitigate the Project's impacts.

If additional mitigation measures for the Project are determined feasible by the City, then the impact at this location would be Less than Significant. Otherwise, as described above, the Project (Phase I) impacts at this location would be Significant and Unavoidable.

Microsimulation Analysis

A microsimulation analysis was conducted to better determine the operational performance of the Alternative Measure DD Configuration. Selected measures of effectiveness (MOEs) were then compared against the original Measure DD Configuration.

As shown in **Table 15**, which summarizes the movement delay for the original Measure DD Configuration and Alternative Measure DD Configuration, the northbound Harrison Street, eastbound 20th Street, and southbound Kaiser Center Access Road approaches to the intersection of Harrison Street / 20th Street / Kaiser Center Access Road would perform poorly (LOS F) under either configuration.

Queuing Conditions

As shown in **Table 16**, which summarize the 95th percentile queues by lane for the original Measure DD Configuration and Alternative Measure DD Configuration, queues on the northbound Harrison Street approach at Harrison Street / 20th Street / Kaiser Center Access Road exceed available storage capacity in the PM peak hour for all Cumulative scenarios, regardless of configuration. Under the original Measure DD Configuration, queues on the eastbound Harrison Street approach at Harrison Street / Lakeside Drive exceed or approach the available storage capacity. The lack of storage between the two key intersections in the original Measure DD Configuration causes spillback queuing along northbound Harrison Street and eastbound

SOURCE: AECOM, 2010.

20th Street, hampering throughput on the northbound Harrison Street and eastbound 20th Street approaches at Harrison Street / 20th Street / Kaiser Center Access Road. These queues then stretch back to upstream intersections, affecting Harrison Street / 19th Street and Webster Street / 20th Street. Likewise, queues on the westbound Harrison Street approach to Harrison Street / Lakeside Drive also exceed the available storage capacity, causing spillback into the upstream intersection at Harrison Street / 21st Street.

Conclusions

The following is a summary of the 12 CEQA related mitigation measures that are expected due to the build-out of the South Tower under Existing Conditions (requiring measures at four intersections) and Cumulative (2030) Conditions (requiring measures at five intersections and three roadways). After implementation of these proposed measures, the South Tower impacts under Existing Conditions would be significant and unavoidable at two of the intersections and less than significant at the other two intersections. Under Cumulative Conditions, the implementation of the measures would result in the South Tower impacts being significant and unavoidable at one intersection; less than significant at the four other intersections and all three roadway segments.

Existing plus South Tower Conditions

- 1) Implement Intersection Mitigation Measure TRANS-12a at the **Oakland Avenue / Perry Place / I-580 Eastbound Ramps** intersection. However, even after implementation of the proposed measure, the South Tower impacts at this intersection would be significant and unavoidable.
- 2) Implement Intersection Mitigation Measure TRANS-12b at the **Harrison Street / 27th Street-Bay Place / 24th Street** intersection. However, even after implementation of the proposed measure, the South Tower impacts at this intersection would be significant and unavoidable.
- 3) Implement Intersection Mitigation Measure TRANS-12c at the **Grand Avenue / El Embarcadero** intersection and the South Tower impacts on this intersection are expected to be less than significant.
- 4) Implement Intersection Mitigation Measure TRANS-12d at the **Grand Avenue / MacArthur Boulevard** intersection and the South Tower impacts on this intersection are expected to be less than significant.

Cumulative (2030) plus South Tower Conditions

- 1) Intersection Mitigation Measure TRANS-13a: Implement Mitigation Measure TRANS-12a. This measure alone should be sufficient to completely mitigate the South Tower impacts at **Oakland Avenue / Perry Place / I-580 Eastbound Ramps**. Therefore, the South Tower impacts are less than significant.
- 2) Intersection Mitigation Measure TRANS-13b: Implement Mitigation Measure TRANS-12b at **Harrison Street / 27th Street-Bay Place / 24th Street**, and also prohibit westbound left turns from Bay Place during the AM peak hour (in addition to the PM peak hour). After implementation of the mitigation measure, the intersection would operate at an acceptable LOS D in both the AM and PM peak hours, mitigating the South Tower impacts at this intersection. Therefore, the South Tower impacts on this intersection are less than significant.
- 3) Intersection Mitigation Measure TRANS-13c: Implement Mitigation Measure TRANS-5d at **Telegraph Avenue / 27th Street**. After implementation of the mitigation measure, the intersection would operate at an unacceptable LOS E in the PM peak hour, but the average

delay for the overall intersection and for critical movements would be reduced to less than Cumulative (2030) without Project conditions, mitigating the South Tower's impacts at this intersection. Therefore, the South Tower impacts on this intersection are less than significant.

- 4) Intersection Mitigation Measure TRANS-13d: Implement Mitigation Measure TRANS-3c at **Harrison Street / Grand Avenue**, and also prohibit southbound Harrison Street left turns in the AM peak period (this movement is already prohibited in the PM peak period). To help enforce the prohibition, extinguishable message signs should be installed on the northbound and southbound approaches. These measures alone would not be sufficient to completely mitigate the South Tower impacts at this intersection, but as discussed for Impact TRANS-3c, there are no feasible mitigation measures to completely mitigate the South Tower impacts. Therefore, the South Tower impacts at this intersection are significant and unavoidable.
- 5) Intersection Mitigation Measure TRANS-13e: Implement Mitigation Measure TRANS-1c at **Harrison Street / 20th Street / Kaiser Center Access Road**:
 - Optimize the traffic signal for the PM peak period.
 - Coordinate the signal timing at this intersection with the adjacent intersections.

To implement this measure, the Project Applicant shall submit to TSD for review and approval PS&E to upgrade the intersection to both City standards and ADA standards at the time of construction. The Applicant shall also fund, prepare, and install the approved plans and improvements, which would make the South Tower impacts on this intersection less than significant.

- 6) Roadway Mitigation Measure TRANS-14a: There are no feasible measures to mitigate the South Tower impact on **I-880 from Oak Street to 5th Avenue**, given the existing alignment and constraints due to lack of right-of-way. Therefore, the South Tower impacts on this roadway segment are significant and unavoidable.
- 7) Roadway Mitigation Measure TRANS-14b: Implement Mitigation Measure TRANS-2a on **Eastbound Grand Avenue from Harrison Street to El Embarcadero**. After implementation of this measure, conditions would remain at an unacceptable LOS, and the South Tower impact would not be mitigated. Therefore, the South Tower impacts on this roadway segment are significant and unavoidable.
- 8) Roadway Mitigation Measure TRANS-14c: To completely mitigate the South Tower's impacts would require substantial capacity improvements such as an additional travel lane on **Northbound Harrison Street / Oakland Avenue from 27th Street to I-580**. Since there are no feasible measures to add such capacity, and the South Tower impacts on this roadway segment are significant and unavoidable.

APPENDIX I

Preliminary Greenhouse Gas Emissions Reduction Plan

GHG EMISSIONS INVENTORY AND REDUCTION ANALYSIS AND DATA

Preliminary Greenhouse Gas Emissions Reduction Plan

date August 20, 2010

to Eric Angstadt, Deputy Director, Oakland Community and Economic Development Agency

from Joan Douglas, AICP, Project Manager
Crescentia Brown, AICP, Project Director

subject Kaiser Center Office Project – Preliminary GHG Emissions Reduction Plan

This preliminary Greenhouse Gas (GHG) Emissions Reduction Plan (or “GHG Plan”) presents GHG emissions inventory estimates and identifies potential GHG emissions reduction measures available for the Kaiser Center Office Project (“Project” or “Proposed Project”). Emission inventories for two Project Alternatives are also presented. This GHG Plan is organized as follows:

Part A: GHG Emissions Inventory and Impacts

- a) Identifies and discusses the emission sources that are included in the inventory, as well as other sources that are not included.
- b) Identifies and discusses Project design features, applicable City Standard Conditions of Approval, regulatory requirements, and General Plan policies and programs that would reduce GHG emissions from the Project.
- c) Estimates the Project’s “unadjusted” (“business as usual”) GHG emissions inventory in carbon dioxide equivalents (CO₂e) for construction and operations, generally excluding the emissions reductions resulting from the considerations in “b,” above.
- d) Estimates the Project’s and the Alternatives’ “adjusted” baseline GHG emissions, which incorporate the emissions reductions resulting from the considerations in “b,” against the CEQA thresholds of significance for GHGs.

Part B: Additional GHG Reduction Measures that May be Considered

- e) Describes a comprehensive set of additional GHG reduction measures that may be implemented by the Project to further reduce GHG emission beyond “adjusted” emissions described in “c” above.

This GHG Plan is considered “preliminary” because it is anticipated that the Project Applicant will continue to develop this GHG Plan to further refine the list of additional GHG reduction measures (including preparation and implementation of an approved Transportation Demand Management [TDM] Plan), whereupon it shall fully satisfy Mitigation Measure AIR-3 and SCA GHG-1 identified in the EIR. The Final GHG Plan will be a document to be updated, refined and implemented throughout the Project.

The information and analysis presented herein has been prepared by Chris Sanchez, ESA Senior Technical Associate, Air Quality/GHG; and Jeff Caton, P.E., LEED AP, Director, ESA Renewable Resources.

Part A: GHG Emissions Inventory and Impacts

1.0 Background and CEQA Context

The analysis presented herein is prepared consistent with both statewide and local guidance on the estimation and evaluation of GHG emissions relative to CEQA. These specifically include amendments adopted on March 18, 2010 to the *CEQA Guidelines* regarding GHG emissions. No significance threshold is included in the amendments; the *CEQA Guidelines* afford the customary deference provided to lead agencies in their analysis and methodologies. The Governor’s Office of Planning and Research (OPR) emphasizes the need for a consistent threshold to analyze projects, specifies that the analyses should be performed based on the best available information, and that if a lead agency determines that a project may generate GHGs, the agency is responsible for quantifying estimated GHG emissions by type and source. The analysis in this GHG Plan is consistent with this guidance.

Local guidance includes the Air Quality CEQA Thresholds of Significance from the Bay Area Air Quality Management District (BAAQMD), adopted June, 2, 2010. These thresholds represent the only quantitative thresholds formally proposed by a regulatory agency with jurisdiction over the Project. In its June 2010 *CEQA Air Quality Guidelines*, BAAQMD is specific as to what sources of emissions should be considered relative to proposed CEQA GHG thresholds¹ (Table 4-2: Guidance for estimating a Project’s Operations GHG Emissions, page 4-6) and also provides the BAAQMD Bay Area Greenhouse Gas Emissions Model (BGM) to estimate GHG emissions from land development of projects. As such, the Project’s baseline GHG emissions inventory presented in this GHG Plan provides emissions data for the sources identified by BAAQMD in its updated Guidelines and applies the adopted significance thresholds. .

¹ Bay Area Air Quality Management District, *California Environmental Quality Act Air Quality Guidelines*, Table 4-3: GHG Quantification Guidance Standard, page 4-6.
http://www.baaqmd.gov/~media/Files/Planning%20and%20Research/CEQA/Draft%20BAAQMD%20CEQA%20Guidelines_Dec%207%202009.ashx

2.0 GHG Emission Sources

2.1 GHG Emission Sources Included in the Inventory

Emissions included in the updated BAAQMD Guidelines and therefore included in the baseline GHG emissions inventory for the Project, if applicable, are:

- Area Source Emissions. These are direct emissions from sources that include natural gas combustion for heating, cooking, fireplaces, or boilers, as well as emissions from landscape maintenance equipment.
- Transportation Emissions. These are direct emissions from mobile sources including automobiles, trucks, motorcycles, and busses.
- Operational Electricity Consumption. These are indirect emissions emitted off-site via non-renewable, non-nuclear electricity generators as a result of increased electrical demand.
- Solid Waste Disposal Emissions. These are indirect emissions associated with waste generation. The non-residential uses at the development would generate waste. A large percentage of this waste would be diverted from landfills by waste reduction, recycling, and composting. Oakland currently diverts a large portion of its waste and has goals to even further reduce the amount of waste sent to a landfill. The remainder of the waste not diverted would be disposed of at a landfill. Landfills emit anthropogenic methane from the anaerobic breakdown of material.
- Operational Fugitive (Direct) Emissions. These direct emissions are most commonly associated with a inadvertent emissions to the atmosphere due to leakage or inherent imperfections in a gas transport or collection system. Direct fugitive GHG emissions that may reasonably be expected to be generated by a commercial building like the Project would consist of GHG refrigerants emitted from leaks or other imperfections in refrigeration or air cooling equipment.
- Operational Water Emissions (embedded energy). These indirect emissions are associated with the electricity used to convey water, due to increased water demand from the Project.
- Operational Wastewater (non-biogenic). The updated Guidelines define indirect emissions from wastewater treatment as including the GHG emissions associated with the electricity use in wastewater treatment and not the biogenic CO₂ process emissions².

2.2 GHG Emission Sources Not Included in the Inventory

Emissions not included in the BAAQMD Guidelines, and therefore not included in the baseline GHG emissions inventory for the Project, are discussed below. These emissions may be considered in addition to those incorporated into the Project's baseline GHG emissions inventory discussed below in Sections 6.0 through 9.0.

² Bay Area Air Quality Management District, *California Environmental Quality Act Air Quality Guidelines*, page 4-7. http://www.baaqmd.gov/~media/Files/Planning%20and%20Research/CEQA/Draft%20BAAQMD%20CEQA%20Guidelines_Dec%207%202009.ashx

- Permitted Stationary Source Equipment. Per BAAQMD, GHG emissions from permitted stationary source equipment are not to be assessed as part of the operational emissions of a land development project, but are instead to be directly compared to BAAQMD's 10,000 metric ton per year threshold for such equipment for the purposes of impact assessment relative to CEQA. GHG emissions from permitted stationary source equipment are not to be included in the project inventory that is used for comparison to either the BAAQMD's proposed threshold of 1,100 metric tons (MT) of CO₂e per day or the efficiency-based threshold of 4.6 MT per year per service population (Tholen, 2010b). The GHG analysis for the Project does not include any permitted stationary source equipment.
- Vegetation Sequestration Change. This is the net change in CO₂ emissions resulting from vegetation change and its associated carbon sequestration. Given the urban location of the Proposed Project, a significant change in sequestration of CO₂ from vegetative sources is not expected.
- Fugitive Refrigeration Emissions. Refrigerant gases such as CFCs, HFCs, and HCFCs have a high global warming potential. Leaks of refrigeration gases were not quantified for the Project. At the entitlement stage of development, data necessary to estimate emissions (the pounds of charge of refrigerant for all air handling units) is not readily available.
- Life Cycle Emissions. Although there is no regulatory definition for "lifecycle emissions," the term is generally used to refer to all emissions associated with the creation and existence of a project, including emissions from the manufacture and transportation of component materials, and even emissions from the manufacture of the machines required to produce those materials. However, since it is impossible to accurately estimate the entire chain of emissions associated with any given project, lifecycle analyses are limited in effectiveness and meaning (relative to assessing or reducing Project-specific emissions for the CEQA analysis). The California Natural Resources Agency (CNRA) has stated that lifecycle analyses are not required under CEQA,³ and in December 2009 CNRA issued new energy conservation guidelines for EIR's that make no reference to lifecycle emissions.⁴ The CNRA's explained that: (1) There exists no standard regulatory definition for lifecycle emissions, and (2) Even if a standard definition for 'lifecycle' existed, the term might be interpreted to refer to emissions "beyond those that could be considered 'indirect effects'" as defined by CEQA Guidelines, and therefore beyond what project managers are required to estimate and mitigate.⁵
- Agricultural Emissions. These are emissions from livestock, from fuel combustion associated with agricultural equipment operation, electricity use and fertilizer application. These sources were assumed not to be generated by the Proposed Project.

³ California Natural Resources Agency, 2009. *Final Statement of Reasons for Regulatory Action: Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB97*, p. 71-72. http://ceres.ca.gov/ceqa/docs/Final_Statement_of_Reasons.pdf (accessed February 4, 2010).

⁴ State CEQA Guidelines, Appendix F. These new guidelines were part of amendments issued pursuant to SB97.

⁵ California Natural Resources Agency, 2009. *Final Statement of Reasons for Regulatory Action: Amendments to the State CEQA Guidelines Addressing Analysis and Mitigation of Greenhouse Gas Emissions Pursuant to SB97*, p. 71. http://ceres.ca.gov/ceqa/docs/Final_Statement_of_Reasons.pdf (accessed February 4, 2010).

- Off Road Equipment Emissions. These are emissions from off-road equipment typically associated with equipment typically associated with industrial or large commercial land uses such as fork lifts, yard dogs and generators. These sources were assumed not to be generated by the proposed office tower project.

3.0 Project Design Features, City Standard Conditions of Approval, Regulatory Requirements, and General Plan Policies and Local Programs that Reduce GHG Emissions

There are many ways for a project to reduce its GHG emissions through its design, construction and operations. Local conditions of approval, policies, programs and regulatory requirements that apply to a project also combine to reduce project GHG emissions. Each of these components is considered part of the Proposed Project and is included in the estimate of the Project's baseline GHG emissions inventory as follows:

3.1 Project Design Features

- **CALGreen – Energy Performance Standard.** One of the objectives of the Project (presented in Chapter 3, Project Description) is to meet contemporary energy and design objectives by ensuring that the new towers meet mandatory CALGreen performance standard under CALGreen and provide the opportunity for the Project, as part of this GHG Plan, to exceed such standards where feasible. CALGreen is a newly enacted building code requirement pursuant to Title 24 of the CCR, which is effective January 2011 and will apply to construction of the Proposed Project. CALGreen will require that every new building constructed in California reduce water consumption by 20 percent, divert 50 percent of construction waste from landfills and install low pollutant-emitting materials. It also requires separate water meters for nonresidential buildings' indoor and outdoor water use, with a requirement for moisture-sensing irrigation systems for larger landscape projects and mandatory inspections of energy systems (e.g., heat furnace, air conditioner and mechanical equipment) for nonresidential buildings over 10,000 square feet to ensure that all are working at their maximum capacity and according to their design efficiencies. The effects of these energy and water saving features are incorporated into the baseline emission inventory for the Proposed Project.

3.2 City Standard Conditions of Approval

City Standard Conditions of Approval (also referred to as "SCAs") are incorporated and required as part of a Proposed Project and are adopted as conditions of approval and required of the project to help ensure less than significant impacts.

The following SCAs are required as part of a Proposed Project and adopted as conditions of approval to help reduce GHG emissions of the Project:

- SCA TRANS-1 – Parking and Transportation Demand Management Plan. SCA TRANS-1 requires the Project applicant to submit for review and approval by the City of Oakland Planning and Zoning Division a Transportation Demand Management (TDM) Plan containing strategies to reduce on-site parking demand and single occupancy vehicle (SOV) travel. Although a TDM Plan for the Project has not yet been prepared, generally, TDM could reduce SOV trips for a large office project near located near transit by about 10 to 20 percent. Calculations of GHG reductions attributable to the TDM Plan preliminarily (and conservatively) assume a 10 percent reduction in Project trip generation. This GHG Plan provides emissions estimates for the project both with and without the preliminary 10 percent projected TDM trip reduction. Once the TDM Plan is completed and approved (prior to certification of the EIR), the appropriate refinement to the Project trip generation and resulting GHG emissions will be calculated and reported in the EIR prior to certification.
- SCA UTIL-1 – Waste Reduction and Recycling. SCA UTIL-1 requires the Project applicant to submit a Construction & Demolition Waste Reduction and Recycling Plan (WRRP) and an Operational Diversion Plan (ODP) for review and approval by the Oakland Public Works Agency. Chapter 15.34 of the Oakland Municipal Code outlines requirements for reducing waste and optimizing construction and demolition (C&D) recycling. Affected projects include all new construction and all demolition. This SCA essentially addresses reduction in construction-related emissions, which the City combines with the Project's operational emissions to assess against the significance thresholds for operational emissions, even though construction emissions are not a component of BAAQMD's Guidelines. Therefore, this SCA will contribute to reducing total emissions of the Project.
- Landscape Requirements and Tree Replacement. SCAs address landscape requirements for frontages of commercial buildings and replacement of trees removed as part of a project. Projects are required to install one tree for every 25 feet of street frontage in cases sidewalks have adequate width. Additionally SCAs generally require the replacement of native trees removed as part of a project. Together, these SCAs that maintain and increase landscaping and trees effect cooler climate, reduce excessive solar gain, and absorb CO₂e emissions over the minimum 3.5 years to construct Phase 2 of the Project, but have no impact on the emissions inventory of the Proposed Project.
- SCA GHG-1- GHG Reduction Plan. SCA GHG-1 applies to certain projects that produce total GHG emissions that exceed the BAAQMD CEQA Thresholds, including commercial office buildings employing 1,000 persons or containing more than 250,000 square feet of total floor area, such as the Proposed Project. SCA GHG-1 requires the Project applicant to prepare a GHG Reduction Plan to increase energy efficiency and reduce GHG emissions to the greatest extent feasible below the BAAQMD CEQA Thresholds. The GHG Reduction Plan will include a comprehensive set of quantified GHG emissions reduction measures in addition to energy efficiencies included as part of the project (including the City's Standard Conditions of Approval, proposed mitigation measures, project design features, and other City requirements. SCA GHG-1 is presented in the detailed Project GHG emissions impact analysis further below and will reduce the GHG emissions of the Project.

3.3 General Plan Policies and City Programs

- Oakland General Plan LUTE. The LUTE is aimed at promoting use of public transit, bicycles and pedestrian travel. Any reduction of transportation-related GHG emissions are captured in the trip reduction associated with the TDM Plan.
- Oakland General Plan Open Space, Conservation and Recreation (OSCAR) Element. The OSCAR contains policies that (a) encourage the provision of open space, which increases vegetation area (trees, grass, landscaping, etc.) to effect cooler climate, reduce excessive solar gain, and absorb CO₂; (b) encourage stormwater management, which relates to the maintenance of floodplains and infrastructure to accommodate potential increased storms and flooding; and (c) encourage energy efficiency and use of alternative energy sources. Policies that address vegetation area have no impact on the emissions inventory as vegetative sequestration is not a component of BAAQMD's Guidelines. Other policies regarding energy efficiency encourage and support energy efficiency but are not requirements under any implementation mechanism via the General Plan. They have resulted, however, in the implementation of the City of Oakland sustainability program discussed below.
- City of Oakland Sustainability Programs. The City has proactively adopted a number of sustainability programs in an effort to reduce the City's impact on climate change. Oakland's sustainability efforts are managed by the Oakland Sustainability Community Development Initiative and there are two main categories that relate to reducing GHG emissions from a development project: renewable energy and green building.

Renewable Energy. With regard to renewable energy, the City's Sustainability Program has set a priority of promoting renewable energy with a particular emphasis on solar generation. The Program's aggressive renewable energy goals include the following: 50 percent of city facilities entire electricity use from renewable sources by 2017; and 100 percent of the city's entire electricity use from renewable sources by 2030. The City has some control over renewable energy percentages for buildings it operates by contracting its energy needs directly with the local utility. However, private building operators generally receive a standard energy mix from PG&E, and would not be required to contract for a higher percentage of renewables under this program as it only targets City facilities. PG&E does have a 20 percent renewable energy mix goal for 2020 (compared to a 12 percent mix in 2007).

Green Building. With regard to green building strategies, the City of Oakland has implemented green building principles in City buildings through the following programs: Civic Green Building Ordinance (Ordinance No. 12658 C.M.S., 2005), requiring, for certain large civic projects, techniques that minimize the environmental and health impacts of the built environment through energy, water and material efficiencies and improved indoor air quality, while also reducing the waste associated with construction, maintenance and remodeling over the life of the building; Green Building Guidelines (Resolution No. 79871, 2006) which provides guidelines to Alameda County residents and developers regarding construction and remodeling; and Green Building Education Incentives for private developers. Green building requirements for private developers are anticipated for adoption in the fall of 2010, however, the baseline emissions inventory for the

Proposed Project assumes implementation of mandatory CALGreen standards as a Project design feature, as discussed above.

3.4 Regulatory Requirements

- *AB 1493 and Amended “Pavley” Regulations.* AB 1493 required the California Air Resources Board (CARB) to develop and adopt, by January 1, 2005, regulations that achieve “the maximum feasible reduction of GHGs emitted by passenger vehicles and light-duty trucks and other vehicles determined by CARB to be vehicles whose primary use is noncommercial personal transportation in the State. The CARB has adopted amendments to the Pavley regulations that reduce GHG emissions in new passenger vehicles from 2009 through 2016. The amendments, approved by CARB on September 24, 2009, are part of California’s commitment toward a nation-wide program to reduce new passenger vehicle GHGs from 2012 through 2016. The model used to estimate the Proposed Project’s GHG emissions for this analysis accounts for reductions of GHG resulting from implementation of Pavley standards.
- *Low Carbon Fuel Standards (LCFS).* On April 23, 2009 CARB approved the regulation to implement the LCFS. The LCFS will reduce GHG emissions from the transportation sector in California by about 16 million metric tons (MMT) in 2020. The model used to estimate the Proposed Project’s GHG emissions for this analysis accounts for reductions of GHG resulting from implementation of LCFS.

Other Project characteristics that reduce GHG emissions and support the Project’s alignment with AB 32 GHG reduction goals include proposed pedestrian improvements. The Project final design is anticipated to include extensive streetscape improvements, including new and increased sidewalk, curb, and gutter; right-of-way landscaping; streetlights; street furniture; wayfinding signage; and/or art. These features, as outlined in the City’s Pedestrian Master Plan adopted in November 2002, are identified as design amenities that develop a pedestrian-oriented environment that facilitate walking and transit use. These features would help reduce transportation-related GHG emissions by encouraging additional pedestrian trips. Also, the Project’s combination of office and commercial/retail uses has the potential to reduce greenhouse gas emissions related to transportation for both the employees and the patrons of each of these uses. Multiple amenities and services an employee or patron might use would be located in this single development, which would reduce vehicle-miles-traveled.

4.0 Baseline GHG Emissions Inventory

4.1 Construction-Related GHGs

Assumptions

Estimated Total and Annualized Construction-generated GHG Emissions

The construction-generated GHG emissions of the Project are shown in **Table 1**, which summarizes the emissions estimates from the principal GHGs (CO₂, CH₄ and N₂O) in metric tons of CO₂e, by construction

year and Project phase. An estimated total 2,081 MT CO₂e emissions from Project construction equipment and vehicles would be emitted over the minimum 3.5 years to construct Phase 1 of the Project, and an estimated total 2,461 MT CO₂e emissions over the minimum 3.5 years to construct Phase 2 of the Project, for a total of approximately 4,542 MT CO₂e emissions over the minimum total construction period of seven years through Buildout. Approximately 46 percent of the total construction GHG emissions is associated with Phase 1 construction, with approximately 54 percent associated with Phase 2 construction.

**TABLE 1
CONSTRUCTION-GENERATED GHG EMISSIONS OF THE PROPOSED PROJECT**

| Construction Year | Annual CO ₂ e Emissions (metric tons per year) | | | |
|--|---|-----------------|------------------|-------------------------|
| | CO ₂ | CH ₄ | N ₂ O | Total CO ₂ e |
| Phase 1 | | | | |
| 2012 | 244 | 0.29 | 1.94 | 246 |
| 2013 | 733 | 0.88 | 5.82 | 740 |
| 2014 | 750 | 0.90 | 5.96 | 757 |
| 2015 (Phase 1) | 335 | 0.40 | 2.66 | 338 |
| Total Phase 1 | | | | 2,081 |
| Phase Construction Emissions per Year (annualized over 40 years) | | | | 52 |
| Phase 2 | | | | |
| 2015 (Phase 2) | 112 | 0.13 | 0.89 | 113 |
| 2016 | 953 | 1.14 | 7.57 | 962 |
| 2017 | 948 | 1.14 | 7.53 | 957 |
| 2018 | 426 | 0.51 | 3.39 | 430 |
| Total Phase 2 | | | | 2,461 |
| Total Construction Emissions – Project Buildout | | | | 4,542 |
| Total Construction Emissions per Year (annualized over 40 years) | | | | 114 |
| Total Construction Emissions per Year (annualized over approximately 7 years to construct the Project) | | | | 649 |

SOURCE: ESA, 2010

Construction emissions are annualized because the proposed operational GHG emissions thresholds are analyzed in terms of metric tons “per year.” Assuming a 40-year development life of the Project until it is demolished or remodeled for energy efficiency (which is the common standard currently used in practice), total construction emissions represent approximately 114 MT CO₂e annually, over 40 years. Annualized over the 3.5-year construction period for Phase 1, the one-time construction-related contribution to GHG emissions is approximately 52 MT CO₂e per year, and over the seven-year construction period of the Project Buildout the one-time construction-related contribution is approximately 649 MT CO₂e per year.

The BAAQMD Guidelines do not include a specific threshold or methodology for assessing construction-related GHG emissions for CEQA analysis. The City’s methodology adds the 40-year annualized construction-related GHG emissions to the Project’s total operational-related emissions, to assess construction-related GHG emissions against the BAAQMD thresholds and Project’s ability to meet AB 32 GHG reduction goals, as discussed below.

The Project includes characteristics that specifically contribute it being consistent with AB 32 GHG reduction goals during construction. The analysis of construction emissions only considers improvements in construction equipment exhaust emissions through manufacturer requirements and turnover. In addition to considering the CO₂e emission from construction activities, the Project would incorporate dust control measures recommended by BAAQMD (Oakland SCA AIR-1, Construction-Related Air Pollution Controls (Dust and Equipment Emissions [Dust Control])), and measures related to construction exhaust emissions (Oakland SCA AIR-2, Construction Emissions). Further, the SCAs that apply to the Project align with BAAQMD regulations that relate to portable equipment (e.g., concrete batch plants, and gasoline- or diesel-powered engines used for power generation, pumps, compressors, pile drivers, and cranes), architectural coatings, and paving materials. Equipment used during project construction would be subject to the requirements of BAAQMD Regulation 2 (Permits), Rule 1 (General Requirements) with respect to portable equipment unless exempt under Rule 2-1-105 (Exemption, Registered Statewide Portable Equipment); BAAQMD Regulation 8 (Organic Compounds), Rule 3 (Architectural Coatings); and BAAQMD Regulation 8 (Organic Compounds), Rule 15 (Emulsified and Liquid Asphalts).

In summary, the annualized GHG emissions from construction of the Project would not conflict with the goals of AB 32.

4.2 Construction and Long-Term Operational GHGs

As introduced above, long-term operational GHG emissions associated with the Project include indirect emissions from mobile sources (motor vehicle trips), emissions from natural gas combustion used in non-residential buildings, emissions from electricity use in non-residential buildings (grid electricity), emissions from water conveyance and waste water treatment and conveyance, and emissions from area sources. Emissions from each of these sources, in addition to the construction-related emissions discussed above, are reported in **Tables 2** and **3**, below.

Unadjusted Operational GHG Emissions

“Unadjusted Operational GHG Emissions” of the Project do not factor in the Project’s design features, applicable City SCAs (including TDM), and regulatory requirements that are considered part of the Project and that reduced the Project’s GHG emissions; it is essentially a “business as usual” approach. Unadjusted emissions do, however, assume the same Project assumptions and inputs used to estimate the Project’s baseline emissions, below. The unadjusted emissions are considered to demonstrate the emissions reductions that are attributable to measures incorporated as part of the Project. As shown in **Table 2**, the total unadjusted annual GHG emissions generated by the Project is approximately 8,197 MT CO₂e per year at Phase 1 and 15,772 MT CO₂e per year at Project Buildout.

TABLE 2
UNADJUSTED OPERATIONAL GHG EMISSIONS INVENTORY FROM THE PROPOSED PROJECT

| Emission Source | Total Annual CO ₂ e Emissions (metric tons per year) | |
|--|---|---|
| | Phase 1 Total CO ₂ e | Project Buildout ^a Total CO ₂ e |
| Motor vehicle trips (no TDM) | 4,570 | 9,143 |
| Natural gas | 734 | 1,749 |
| Grid Electricity | 2,538 | 3,966 |
| Water Conveyance | 11 | 20 |
| Wastewater Treatment & Conveyance | 12 | 22 |
| Solid Waste | 280 | 758 |
| Area Source (landscape maintenance) | 0.24 | 0.24 |
| Total Unadjusted Operational Project GHG Emissions without Construction Emissions | 8,145 | 15,658 |
| Construction Emissions per Year (annualized over 40 years) (see Table IV.B-9) | 52 | 114 |
| Total Unadjusted Operational Project GHG Emissions with Construction Emissions | 8,197 | 15,772 |
| Total Unadjusted Operational Project GHG Emissions by Service Population | 5.7^b | 4.8^b |

^a Project Buildout includes Phase 1 (South Tower) and Phase 2 (North Tower) and all other Project components

^b Total emissions divided by service population of 1,423 net new employees for the Project at Phase 1, and 3,233 net new employees for the Project at Buildout.

SOURCE: ESA, 2010

Assumptions and Estimated Baseline Adjusted Operational GHG Emissions, by Source

- Mobile Source (Motor Vehicle) Emissions.** The Proposed Project consists of high-density commercial development located within walking distance of public transportation, designed to minimize the use and impacts of private automobiles. The Project mobile source emissions would result from the typical daily operation of motor vehicles by employees, customers and vendors. Vehicle trip generation from the Proposed Project is based on information from the transportation analysis in Table IV.L-9 of the DEIR. The Proposed Project would result in a net increase of 7,966 standard vehicle trips per day over existing conditions without the preliminary 10 percent TDM reduction, and 7,169 standard vehicle trips per day over existing conditions with the assumed preliminary 10 percent TDM trip reduction. Emissions for vehicle trips were calculated using the URBEMIS2007 computer model and the BGM of the BAAQMD. Trip generation rates of the BGM were adjusted to reflect the Project-specific vehicle trip generation presented in the DEIR. The calculation used the model default vehicle trip lengths specific to urban areas of Alameda County in the San Francisco Bay Area Air Basin.

BGM calculates the CO₂, CH₄ and N₂O emissions from motor vehicle trips based on trip generation and trip lengths and other data in the URBEMIS model. BGM uses CH₄ and N₂O emission factors from CCAR and multiplies them by their respective global warming potential (GWP) to convert them to CO₂e. BGM also takes into account emissions reductions that would result from the implementation of Pavley greenhouse gas standards and the LCFS. The resulting total Project mobile source emissions are estimated to be approximately **8,359 MT CO₂e per year** *without the preliminary 10 percent TDM reduction* and **7,515 MT CO₂e per year** *with the preliminary 10 percent TDM reduction*.

- Project Natural Gas Combustion Emissions. GHG emission estimates from natural gas were calculated using the BGM of BAAQMD. The Project-related natural gas GHG emissions are estimated to be 1,749 MT CO₂e per year. GHG emissions from existing buildings to be demolished represent 371 MT CO₂e per year. The net increase in GHG emissions from natural gas resulting from the Proposed Project are estimated to be **1,632 MT CO₂e per year**.
- Indirect Project Electrical GHG Emissions. Non-residential buildings require electricity for space and water heating, air conditioning, lighting, and plug-in outlets. The amount of energy used (and the amount of associated GHG emissions emitted) per dwelling unit would vary with the type of residential building.

GHGs are indirectly emitted as a result of electrical service required for a Proposed Project. GHGs are emitted during the generation of electricity from fossil fuels. When electricity is used in a building, a portion of the electricity is typically generated off site at a power plant, while the remaining percentages are generated by renewable resources such as hydroelectric dams. The relative percentages of renewable and non-renewable resources vary from year-to-year based on the magnitude of available water flows at hydroelectric dams and other source variables. Currently, electricity provided by the standard PG&E grid invariably represents indirect emissions of GHGs from the combustion of fossil fuels. PG&E maintains annual records on the percentage of electricity from renewable and non-renewable resources and, using this data, calculates an average annual emission factor (CO₂e emission rate per kilowatt of electricity generated) for its sources.

BGM was not used to calculate GHG emissions because it uses statewide composite emission factors that cannot be adjusted in the model. Because PG&E would be the electrical provider for the Proposed Project and because PG&E calculates its own emission factors based on its percentage of renewable energy within its portfolio.

For the Project inventory, all indirect electricity emission factors are drawn from the most recent PG&E's calculation of a 5-year rolling average and have been adjusted to incorporate its fluctuating Renewable Portfolio Standard. The PG&E emission factor is provided in terms of CO₂e and does not separate out the individual contribution of CH₄ and N₂O. While fossil fuel combustion generates CH₄ and N₂O, the emissions of these GHGs typically comprise less than one percent of total CO₂e emissions.

Project electrical GHG emissions were calculated based on energy demand estimates for commercial buildings contained in the California Energy Commission's latest *California Energy*

Demand Staff Report adopted in December 2009. The Proposed Project will construct the buildings to 2010 CALGreen standards that will become mandatory by 2011. To achieve CALGreen Tier I energy efficiency, buildings must achieve 15 percent beyond Title 24, part 6. For the inventory these standards were applied to the Proposed Project and a 15 percent reduction in energy demand was incorporated into the calculation of GHG emissions from grid electricity. The resulting energy demand was then converted to GHG emissions by using the appropriate emission factors discussed above. To determine the net increase resulting from the Project, the GHG emissions from existing structures to be demolished were subtracted from Project emissions. The resulting net Project-related electrical GHG emissions are estimated to **3,099 MT CO₂e per year**.

- Water and Wastewater Treatment and Conveyance. The Project GHG inventory includes emissions associated with drinking water and wastewater supply and treatment. In general, the majority of these emissions are indirect emissions associated with the energy used to convey, treat, and distribute water and wastewater. Additional emissions from wastewater treatment include CH₄ and N₂O, which are emitted directly from wastewater treatment processes.

The amount of electricity required to treat and supply water is a function of water use. According to Section 4.M, Utilities and Service Systems, of the DEIR, the Project would generate a net water demand of 119,000 gallons per day (gpd) after accounting for existing uses in the buildings to be demolished. Implementation of the proposed CALGreen standard would reduce water demand by an additional 20 percent (projected).

Three main processes are required to supply potable water to residential and commercial users: (1) supply and conveyance of the water from the source; (2) treatment of the water to potable standards; and (3) distribution of the water to individual users. Indirect emissions resulting from electricity use were determined by multiplying electricity use by California statewide CO₂, CH₄ and N₂O emission factors from CCAR's General Reporting Protocol. Statewide emission factors are used rather than local PG&E factors to reflect the fact that drinking water from the local water utility (EBMUD) is pumped from a variety of sources including primarily the Mokelumne River watershed in the eastern Sierras and therefore has the potential to be pumped through the jurisdictions of electricity providers other than PG&E.

Energy use for the various aspects of water treatment (e.g., source water pumping and conveyance, water treatment, distribution to users) was determined using the stated water demand and energy intensity values from the CEC that are also recommended for use by BAAQMD in its latest proposed Air Quality Guidelines.

Emissions associated with wastewater treatment include indirect emissions associated with powering the treatment process and direct emissions from degradation of organic material in the wastewater, which are biogenic in nature and not considered as part of the Project's GHG inventory. Wastewater discharge from the Proposed Project is estimated in Section 4.M, Utilities and Service Systems, of the EIR, to be 105,500 mgd. Implementation of the proposed CALGreen standard would reduce water demand by an additional 20 percent. In total, all municipal of water and wastewater treatment and conveyance for the Project is expected to produce **39 MT CO₂e**

annually: approximately **15 MT CO₂e per year** attributable to water conveyance and approximately **24 MT CO₂e per year** attributable to wastewater treatment and conveyance.

- Solid Waste. The updated BAAQMD Air Quality Guidelines now specifically identifies emissions from solid waste as an element to be included in a GHG inventory for comparison to their proposed GHG significance thresholds. For solid waste, BGM uses the emission factors compiled by CALrecycle to estimate GHG emissions. For office uses the factor used is one of the highest and is from an unverifiable source in a Ventura County EIR. This analysis used the user override function to apply an office land use waste generation use rate of 1.999 pounds per 1,000 square feet per year. This rate is consistent with what was in the EIR and is also from Cal recycle.

BGM uses a two step process. In the first step, BGM estimates the amount of solid waste that the project will generate based on solid waste generation rates compiled by Calrecycle (formerly the California Integrated Waste Management Board). In the second step, BGM estimates the GHG emissions associated with that solid waste.

The solid waste GHG emissions include two components: truck hauling emissions and emissions resulting from the decomposition of solid waste. Truck hauling emissions use the vehicle miles traveled (VMT) estimates described in Step 1 and multiply them by EMFAC2007 emission rates for heavy heavy-duty trucks. An EMFAC2007 modeling run was used to estimate CO₂ and CH₄ emissions in grams per mile for trucks traveling at an average speed of 35 mph. Truck emissions also account for the Low Carbon Fuels Rule. For this Project, BGM was adjusted to assume that solid waste was assumed to be disposed of at Altamont Landfill for a round trip distance of 75 miles.

BGM uses the U.S. EPA WARM Model emission rates for mixed solid waste decomposition. Those rates equal 3.1 metric tons of CO₂e per short ton of solid waste that is land filled, assuming no recovery, 0.64 tons CO₂e per short ton, assuming land filled waste with flaring, and 0.3 tons CO₂e per short ton, assuming land filled waste with energy recovery. For the Project, the scenario with landfill recovery was assumed, as Altamont landfill implements landfill gas (LFG) recovery and energy conversion, including running some of its vehicles on collected LFG. BGM calculates the net increase in GHG emissions from the increase in solid waste generation of the Proposed Project to be **462 MT CO₂e per year**.

- Area Sources. Area source emissions stem from hearths (including gas fireplaces, wood-burning fireplaces, and wood-burning stoves) and small mobile fuel combustion sources such as lawnmowers and other landscape maintenance equipment. For commercial development with no hearth facilities, such as the Proposed Project, area source emissions of GHG would be entirely due to landscape maintenance equipment.

For the Proposed Project, the URBEMIS model indicates practically no quantifiable change in GHG emissions from landscape equipment compared to the existing uses to be demolished. The net increase of area source emissions in the Project GHG inventory is approximately **0.24 MT CO₂e per year**.

Estimated Adjusted Total Baseline Operational GHG Emissions

“Baseline Operational GHG Emissions” of the Project factor in all the emissions reduction components described in Section 3.0, which are part of the Project: the Project design features, applicable City SCAs (including TDM, but excluding SCA GHG-1), and regulatory requirements. Although a TDM Plan for the Project (required by SCA TRANS-1) has not yet been prepared, generally, TDM could reduce SOV trips for a large office project near located near transit by about 10 to 20percent. Baseline emissions are reported with and without a preliminary (and conservative) 10 percent TDM trip reduction assumption.

**TABLE 3
BASELINE OPERATIONAL GHG EMISSIONS INVENTORY
FROM THE PROPOSED PROJECT**

| Emission Source | Annual CO ₂ e Emissions
(metric tons per year) | |
|--|--|--|
| | Phase 1 Total CO ₂ e | Project Buildout ^a
Total CO ₂ e |
| Motor vehicle trips without TDM / with TDM ^a | 4,190 / 3,771 | 8,359 / 7,515 |
| Natural gas | 682 | 1,632 |
| Grid Electricity | 1,995 | 3,099 |
| Water Conveyance | 8 | 15 |
| Wastewater Treatment & Conveyance | 13 | 24 |
| Solid Waste | 170 | 462 |
| Area Source (landscape maintenance) | 0.24 | 0.24 |
| Total Baseline Operational Project GHG Emissions without TDM / with TDM, without Construction Emissions | 7,058 / 6,639 | 13,591 / 12,747 |
| Construction Emissions per Year (annualized over 40 years) (see Table IV.B-9) | 52 | 114 |
| Total Baseline Operational Project GHG Emissions without TDM / with TDM, with Construction Emissions | 7,110 / 6,691 | 13,705 / 12,861 |
| BAAQMD Threshold of Significance | 1,100 | 1,100 |
| <i>Exceeds Threshold?</i> | Yes | Yes |
| Total Operational Project GHG Emissions by Service Population without TDM / with TDM | 5.0 / 4.7^c | 4.2 / 3.9^d |
| BAAQMD Threshold of Significance | 4.6 | 4.6 |
| <i>Exceeds Threshold?</i> | Yes | No |
| Impact Determination | Significant | Less than Significant^e |

^a Project Buildout includes Phase 1 (South Tower) and Phase 2 (North Tower) and all other Project components

^b Assumes preliminary 10 percent TDM reduction of vehicle trips.

^c Total emissions divided by service population of 1,423 net new employees for Phase I of the Project.

^d Total emissions divided by service population of 3,233 net new employees for the Project at Buildout.

^e For projects that meet the City's definition of a "very large project," the City requires the Project applicant to prepare a GHG Reduction Plan as a Standard Condition of Approval, even though no CEQA impact is identified.

SOURCE: ESA, 2010

The total annual baseline GHG emissions generated by the Project not assuming the preliminary 10 percent TDM reduction is approximately 13,705 MT CO₂e per year, including

construction emissions. See Table 3, which shows emissions for Phase 1 and Buildout (Phase 1 and Phase 2). The table reveals that the majority of annual Project emissions results from vehicle use (62 percent), followed by electrical demand (23 percent). As a result, the Project would generate GHG emissions of approximately **4.2 MT CO₂e per year per capita of service population**, which is the total annual GHG emissions divided by the Project's estimated total service population of 3,233 net new employees.⁶

The total annual baseline GHG emissions generated by the Project *assuming the preliminary 10 percent TDM reduction* is approximately **12,861 MT CO₂e per year**, exclusive of one-time construction emissions for which BAAQMD has specifically not proposed a threshold of significance. See Table 3. The majority of the annual Project emissions would continue to result from vehicle use (59 percent), followed by electrical demand (24 percent). Total Project GHG emissions would be approximately **3.9 MT CO₂e per year per capita of service population**.

Comparison of Unadjusted and Baseline Emissions

The difference in the baseline and unadjusted GHG emissions of the Project generally demonstrate the extent of emissions reduction that is attributable to measures incorporated with the Project.

At Phase 1, the total annual GHG emissions generated by the Project, *assuming no TDM reduction* (7,110 MT CO₂e shown in Table IV.B-11), is approximately 1,087 MT CO₂e per year less than the Project's estimated unadjusted Phase 1 emissions (8,197 MT CO₂e shown in IV.B-10). This is a reduction of approximately 13 percent. The most substantial reductions are associated with motor vehicle emissions (approximately 380 MT CO₂e per year less than the unadjusted emissions, based primarily on implementation of Pavley GHG standards and the LCFS since no TDM is assumed) and indirect electricity emissions (approximately 543 MT CO₂e per year less than the unadjusted emissions, which do not consider the Project's adherence to CALGreen standards, as discussed in the assumptions, above).

At Buildout, the total annual GHG emissions generated by the Project, *assuming no TDM reduction* (13,705 MT CO₂e shown in Table IV.B-11), is approximately 2,067 MT CO₂e per year less than the Project's estimated unadjusted emissions (15,772 MT CO₂e shown in IV.B-10). This is a reduction of approximately 13 percent (as with Phase 1). Again, the most substantial reductions are associated with motor vehicle emissions (approximately 784 MT CO₂e per year less than the unadjusted emissions, based primarily on implementation of Pavley GHG standards and the LCFS since no TDM is assumed) and indirect electricity emissions (approximately 867 MT CO₂e per year less than the unadjusted emissions, which do not consider the Project's adherence to CALGreen standards).

⁶ Total Service Population is calculated as the sum of additional net new residents (zero) and 3,233 net new employees associated with the Project.

Impacts of Baseline Operational GHG Emissions

Based on the project-level significance thresholds, the Project would have a significant impact on the environment if it would produce total emissions of more than 1,100 metric tons of CO₂e annually *and* more than 4.6 metric tons of CO₂e per service population annually, or conflict with an applicable plan, policy, or regulation adopted for the purposes of reducing greenhouse gas emissions.

Impact at Phase 1

For Phase 1, as shown in Table IV. B-11, the Project's total annual GHG emissions *not assuming the preliminary 10 percent TDM reduction* is approximately 7,110 MT CO₂e, which exceeds the 1,100 MT CO₂e per year threshold. Also, the Project's 5.0 MT CO₂e per year per capita of service population exceeds the 4.6 MT CO per year threshold. Similarly, *assuming the preliminary 10 percent TDM reduction*, the Project's total annual GHG emissions is approximately 6,691 MT CO₂e, which exceeds the 1,100 MT CO₂e per year threshold, and the 4.7 MT CO₂e per year per capita of service population exceeds the 4.6 MT CO per year threshold. Therefore, the Project would have a significant cumulative GHG impact in Phase 1 because its emissions would exceed both the 1,100 MT CO₂e per year threshold *and* the 4.6 MT CO₂e per year service population threshold.

Impact at Total Buildout

At Buildout, as shown in Table IV.B-11, the Project's total annual GHG emissions *not assuming the preliminary 10 percent TDM reduction* is approximately 13,705 MT CO₂e, which exceeds the 1,100 MT CO₂e per year threshold. However, the Project's 4.2 MT CO₂e per year per capita of service population does not exceed the 4.6 MT CO per year threshold. Similarly, *assuming the preliminary 10 percent TDM reduction*, the Project's total annual GHG emissions is approximately 12,861 MT CO₂e, which exceeds the 1,100 MT CO₂e per year threshold, but the 3.9 MT CO₂e per year per capita of service population does not exceed the 4.6 MT CO per year threshold. Therefore, at Buildout, the Project would not have a significant cumulative GHG impact because it would not exceed the 4.6 MT CO₂e per year service population threshold, even though it would exceed the 1,100 MT CO₂e per year threshold.

5.0 Alternatives GHG Emissions Inventory and Impacts

This section presents the relative operational GHG emissions and resulting impacts for Alternative 1 (South Tower Build Only) and Alternative 2 (Onsite Maximum Reduced Impacts). Table 4 summarizes the relative emissions and impacts of the two alternatives and the Proposed Project. The emissions inventory for Alternatives 1 and 2 are presented below in Tables 4 and 5, respectively.

TABLE 4
COMPARISON OF OPERATIONAL GHG EMISSIONS AND IMPACTS FOR THE
PROPOSED PROJECT AND ALTERNATIVES

| | Annual CO ₂ e Emissions (metric tons per year) | | |
|--|---|--|--|
| | Proposed Project | Alternative 1
(South Tower
Build Only) | Alternative 2
(Onsite Maximum
Reduced) |
| Total Operational GHG Emissions
(without TDM / with TDM) ^a | 13,591 / 12,747 | 7,110 / 6,691 | 2,554 / 2,304 |
| <i>Exceeds BAAQMD 1,100 MT CO₂e
threshold?</i> | Yes | Yes | Yes |
| Total Operational GHG Emissions by
Service Population (without TDM / with
TDM) | 4.2 / 3.9 ^b | 5.0 / 4.7 ^c | 3.9 / 3.5 ^d |
| <i>Exceeds 4.6 MT CO₂e per Service
Population threshold?</i> | No | Yes | No |
| IMPACT DETERMINATION | Less than
Significant | Significant | Less than
Significant |
| Total Construction GHG Emissions | 4,542 | 2,081 | 2,081 |
| Annualized Construction Emissions | 114 over 40 years | 52 over 40 years | 52 over 40 years |
| ^a Assumes preliminary 10 percent TDM reduction of vehicle trips and annualized construction emissions.
^b Total emissions divided by service population of 3,233 net new employees for the Project at Buildout.
^c Total emissions divided by service population 1,423 net new employees for Phase I of the Project.
^d Total emissions divided by service population 647 net new employees for the reduced Project. | | | |

5.1 Alternative 1 (South Tower Build Only)

GHG Emissions for Alternative 1 were calculated similarly to those for the Proposed Project, with a few differences:

- Emissions from increased electricity demand for water and wastewater treatment and conveyance were calculated based on the prorated reduction of square feet of development (approximately 56 percent) compared to the Proposed Project. Existing uses to be demolished under this alternative would be 22,000 square feet, reduced from 280,000 square feet to be demolished under the Project.
- Since this Alternative would be completed earlier (2015) than the Proposed Project (2019), the effect of the Pavley GHG Standards (AB 1493) on mobile emissions would not be as great since fewer Pavley-compliant models would part of the vehicle fleet.

The detailed emissions inventory for Alternative 1 (which is the same as Phase 1 of the Proposed Project) is shown in Table 3. As shown in Tables 3 and 4, the total annual GHG emissions generated from Alternative 1, including the design features related to energy use and transit, is approximately **7,110 MT CO₂e per year** *not assuming the preliminary 10 percent TDM reduction* (compared to 13,705 MT CO₂e

for the Proposed Project). The majority of estimated GHG emissions for Alternative 1 results from vehicle use (59 percent), followed by electrical demand (28 percent), similar to sources for the Proposed Project. The total operational emissions for Alternative 1 exceeds the 1,100 MT CO₂e per year threshold. Alternative 1 emissions *assuming the preliminary 10 percent TDM reduction* would total approximately 6,694 MT CO₂e per year, which would still exceed the 1,100 MT CO₂e per year threshold.

As also shown in Tables 3 and 4, the resulting emissions estimate for the proposed Alternative 1 on an annual per capita service population basis is **5.0 MT CO₂e per year** *not assuming the preliminary 10 percent TDM reduction* (compared to 4.2 MT CO₂e for the Proposed Project). This was calculated by dividing total emissions (7,110 MT CO₂e) by the service population associated with this Alternative 1, which would only build the South Tower (1,423 net new employees).⁷ This service population-based estimate for Alternative 1 exceeds the 4.6 MT CO₂e per year service population threshold, which is not exceed under the Proposed Project. Alternative 1 emissions *assuming the preliminary 10 percent TDM reduction* on an annual per capita service population basis would be **4.7 MT CO₂e per year**, which would still exceed the 4.6 MT CO₂e per year service population.

A project that exceeds **both** thresholds is considered a significant impact. Thus, Alternative 1 would result in a significant cumulative GHG impact under the BAAQMD thresholds.

5.2 Alternative 2 (On-Site Maximum Reduced Impacts)

- GHG Emissions for Alternative 2 were calculated similarly to those for the Proposed Project, with the following differences: Emissions from increased electricity demand for water and wastewater treatment and conveyance were calculated based on the prorated reduction of square feet of development (approximately 80 percent) compared to the Proposed Project.
- Existing uses would be demolished.

As shown in Tables 4 and 5, the total annual GHG emissions generated from Alternative 2 including the design features related to energy use and transit is approximately **2,554 MT CO₂e per year** *not assuming the preliminary 10 percent TDM reduction* (compared to 13,705 MT CO₂e for the Proposed Project). The majority of GHG emissions for Alternative 2 results from vehicle use (83 percent), followed by natural gas demand (11 percent), which is a notably higher portion from vehicle use and a lower portion from natural gas, compared to the Proposed Project and to Alternative 1. The total operational emissions for Alternative 2 exceed the proposed bright-line 1,100 MT CO₂e per year threshold. Alternative 2 emissions *assuming the preliminary 10 percent TDM reduction* would total approximately **2,304 MT CO₂e per year**, which would still exceed the 1,100 MT CO₂e per year threshold.

As also shown in Table 5, the resulting emissions estimate for the proposed Alternative 2 on an annual service population basis is **3.9 MT CO₂e per year** *not assuming the preliminary 10 percent TDM reduction* (compared to 4.2 MT CO₂e for the Proposed Project). This was calculated by dividing total emissions (2,554 MT CO₂e) by the service population associated with this Alternative (647 net new employees). This service population-based estimate for Alternative 2 is below the 3.9 MT CO₂e per year service population threshold. Alternative 2 emissions *assuming the preliminary 10 percent TDM*

⁷ Alternative 1 results in a greater service population than the Proposed Project given the relatively lower ratio of employees to total emissions.

reduction on an annual per capita service population basis would be **3.5 MT CO₂e per year**, which is further below the 4.6 MT CO₂e per year service population.

Like the Proposed Project (and Alternative 1), Alternative 2 exceeds the 1,100 MT CO₂e per year threshold, and like the Proposed Project (at Buildout) it is below the service population threshold. Therefore, Alternative 2 would result in a less-than-significant cumulative GHG impact under the BAAQMD thresholds.

TABLE 5
OPERATIONAL GHG EMISSIONS INVENTORY FROM
ALTERNATIVE 2 (ON-SITE MAXIMUM REDUCED IMPACTS)

| Emission Source | Annual CO ₂ e Emissions
(metric tons per year) |
|--|--|
| | Total CO ₂ e |
| Motor vehicle trips without TDM / with TDM ^a | 2,078 / 1,870 |
| Natural gas | 274 |
| Grid Electricity | 71 |
| Water Conveyance | 4 |
| Wastewater Treatment & Conveyance | 6 |
| Solid Waste | 69 |
| Area Source (landscape maintenance) | 0.24 |
| Total Baseline Operational Project GHG Emissions
without TDM / with TDM (no Construction Emissions_ | 2,502 / 2,252 |
| Construction Emissions per Year Annualized over 40
years | 52 |
| Total Baseline Operational Project GHG Emissions
without TDM / with TDM | 2,554 / 2,304 |
| BAAQMD Threshold of Significance | 1,100 |
| <i>Exceeds Threshold?</i> | Yes |
| Total Operational Project GHG Emissions by Service
Population without TDM / with TDM | 3.9 / 3.5 ^b |
| BAAQMD Threshold of Significance | 4.6 |
| <i>Exceeds Threshold?</i> | No |
| <i>Does Project Meet "Very Large Project" Definition?</i> | No |
| IMPACT DETERMINATION | Less than Significant |

^a Assumes preliminary 10 percent TDM reduction of vehicle trips and annualized construction emissions.

^b Total emissions divided by service population 647 net new employees for the reduced Project.

SOURCE: ESA, 2010

PART B: Available GHG Reduction Measures

In preparing this preliminary GHG Reduction Plan, ESA consulted multiple sources including the State of California's Climate Change Scoping Plan (December 2008), the State Attorney General's web site, the California Air Pollution Control Officer Association's (CAPCOA) white paper on CEQA and Climate Change (January 2008), Reference Guides on Leadership in Energy and Environmental Design (LEED) published by the US Green Building Council, and BAAQMD's CEQA Air Quality Guidelines. ESA identified and assessed the feasibility of emission reduction measures from these various sources to identify "additional" measures for potential implementation during development and operation of the Project. This analysis presents a best-professional effort to identify available reduction strategies and does not assume to be exhaustive in its scope.

6.0 GHG Reduction Measures Identified in the Climate Change Scoping Plan of the California Air Resources Board

Table IV.B-8 of the DEIR presented the 39 Recommended Actions (qualitative measures) identified to date by CARB's Scoping Plan. Of the 39 measures identified, those considered to have potential application to the Proposed Project are primarily related to transportation, electricity and natural gas use and green building design. Each of these measures is evaluated below, by source-type, for its applicability to the Proposed Project, its emission reduction potential, and for its inclusion in the Proposed Project as currently designed.

6.1 Transportation

CARB's Scoping Plan identifies nine transportation-related recommended actions. **Action T-1** concerns improvements to light-duty vehicle technology for the purposes of reducing GHG emissions (Pavley Standards). This action focuses on legislating improved controls for vehicle manufacturers and would not generally be considered applicable to the Proposed Project. However, it is reasonably anticipated that vehicles utilized by the Proposed Project would be subject to the new Pavley regulation. BGM took into account emissions reductions that would result from the implementation of the Pavley Standards, therefore this action does not represent additional mitigation available to the City and Project applicant.

Action T-2 concerns implementation of a LCFS. To reduce the carbon intensity of transportation fuels, CARB is developing a LCFS, which would reduce the carbon intensity of California's transportation fuels by at least ten percent by 2020 as called for by Governor Schwarzenegger in Executive Order S-01-07. LCFS will incorporate compliance mechanisms that provide flexibility to fuel providers in how they meet the requirements to reduce GHG emissions. Implementation of such a standard is not within the purview of a development project and this action does not represent additional mitigation available to the City and Project applicant. BGM took into account emissions reductions that would result from the implementation of the LCFS.

Action T-3 addresses regional transportation targets for reducing GHG emissions. SB 375 requires CARB to develop, in consultation with MPOs, passenger vehicle GHG emissions reduction targets for

2020 and 2035 by September 30, 2010. It sets forth a collaborative process to establish these targets, including the appointment by CARB of a Regional Targets Advisory Committee to recommend factors to be considered and methodologies for setting GHG emissions reduction targets. SB 375 also provides incentives – relief from certain CEQA requirements for development projects that are consistent with regional plans that achieve the targets. While no targets have been set pursuant to SB 375 and the Sustainable Community Strategy for the region will likely not be adopted prior to 2012, the Proposed Project will be required to implement TDM measures which reduce VMT as a Standard Condition of Approval. Although there are presently no details as to what specific measures would and what would not be included in the TDM Plan, a preliminary estimated 10 percent vehicle trip reduction was accounted for in the Project inventory reported in Table 3. As such, TDM measures represent a potential available means of further reducing GHG emissions from the Project.

Action T-4 is concerned with vehicle efficiency measures. The California Integrated Waste Management Board (CIWMB) with various partners continues to conduct a public awareness campaign to promote sustainable tire practices. CARB is pursuing a regulation to ensure that tires are properly inflated when vehicles are serviced. Because the Proposed Project would not involve the operation of fleet vehicles, this action does not represent additional mitigation available to the City and Project applicant.

Actions T-5 and T-6 addresses electrification of ships at ports and port operations and is not applicable to the Proposed Project. Therefore, this action does not represent additional mitigation available to the City and Project applicant.

Action T-7 requires addresses existing trucks/trailers to be retrofitted with the best available technology and/or CARB-approved technology. This action does not represent additional mitigation available to the City and Project applicant.

Action T-8 focuses on hybridization of medium- and heavy-duty vehicles. The implementation approach to Action T-8 is to adopt a regulation and/or incentive program that reduces GHG emissions by encouraging hybrid technology as applied to vocational applications that have significant urban, stop-and-go driving, idling, and power take-off operations in their duty cycle. Such applications include parcel delivery trucks and vans. This action does not represent additional mitigation available to the City and Project applicant.

Action T-9 concerns implementation of a high speed rail (HSR) system. This action does not represent additional mitigation available to the City and Project applicant.

6.2 Electricity and Natural Gas

Action E-1, together with **Action GB-1** (Green Building), aims to reduce electricity demand by increased efficiency of Utility Energy Programs and adoption of more stringent building and appliance standards. Elements of this action include encouraging construction of zero net energy (ZNE) buildings and implementation of passive solar design. In addition to employing on-site electricity generation, a ZNE building must either replace natural gas with renewable energy for space and water heating, or compensate for natural gas use by generating surplus electricity for sale on the state's electricity grid. The Project proposes to construct the proposed towers consistent with the updated CALGreen building code standards which will become effective in January 2011. Compliance with CALGreen standards was

accounted for in the inventory presented in Table 3. The intent of compliance with CALGreen standards is generally consistent with the objectives of Action E-1 and GB-1. However, the Proposed Project does not currently include any form of on-site electricity generation. Consequently, on-site power generation represents a potential additional mitigation measure .

Action E-2 encourages an increase in the use of combined heat and power (CHP) use, or co-generation, facilities. California has supported CHP for many years, but market and other barriers continue to keep CHP from reaching its full market potential. Increasing the deployment of efficient CHP will require a multi-pronged approach that includes addressing significant barriers and instituting incentives or mandates where appropriate. Co-generation would not be applicable to the Project site as it would require a constant need for steam that is absent. This action does not represent additional mitigation available to the City and Project applicant.

Action E-3 concerns Renewable Portfolio Standards for utilities and does not apply to development projects. Therefore, the Proposed Project would not conflict with the recommended measure.

Action E-4 strives to promote solar generated electricity. As discussed with respect to Action E-1, the proposed Project does not currently include any form of on-site electricity generation. Consequently, on-site power generation represents a potential additional mitigation measure.

7.0 GHG Reduction Measures Identified in the California Air Pollution Control Officers Association (CAPCOA) CEQA and Climate Change Guidance Document

Proposed project design elements and mitigation measures may be compared to the list of 64 project-specific mitigation measures developed by the CAPCOA in their document *CEQA and Climate Change*.⁸ **Table 7** presents an itemized list of each of the project-specific mitigation measures identified in the CAPCOA document and correlates them to any existing or Proposed Project elements. Mitigation measures which are not proposed by the project or identified as a Standard Condition of Approval or Mitigation Measure in the DEIR are then identified as potential GHG reduction measures if they are deemed applicable to the type of project proposed. The State Attorney General has also published a list of various “measures that may reduce the global warming related impacts of a project.”⁹ These measures are generally included in CAPCOA’s more extensive listing of GHG mitigations and are not repeated.

⁸ California Air Pollution Control Officers Association, *CAPCOA White Paper - CEQA and Climate Change*. CAPCOA, 2008, <http://www.capcoa.org/ceqa/CAPCOA%20White%20Paper%20-%20CEQA%20and%20Climate%20Change.pdf>, accessed on October 23, 2008.

⁹ California Department of Justice, Attorney General Edmund G. Brown Jr., *The California Environmental Quality Act Addressing Global Warming Impacts at the Local Agency Level*, December 9, 2008, http://ag.ca.gov/globalwarming/pdf/GW_mitigation_measures.pdf, accessed on July 1, 2009.

TABLE 7
CAPCOA-IDENTIFIED GHG MITIGATION MEASURES

| Mitigation Measure | Description | Reduction Estimate | Existing or proposed by the project? |
|--------------------|---|--|--|
| MM T-1 | Bike parking | 1-5 percent for MM T-1, MM T-2, and MM T-3 | Yes Municipal Code Chapter 17.117 requires new development to provide both short-term (i.e., bicycle racks) and long-term bicycle parking (i.e., lockers or indoor storage) for bicycles per SCA TRANS 2 the applicant shall submit for review and approval of the Planning and Zoning Division, plans that show bicycle storage and parking facilities to accommodate 75 short-term bicycle parking spaces onsite or on public sidewalk, and 136 long-term bicycle parking spaces |
| MM T-2 | End of trip facilities (i.e., showers and lockers) | | Yes – Showers (20) and lockers (80) to be installed for office uses per Table 4.L-18 of the DEIR. |
| MM T-3 | Bike parking (residential) | | Not Applicable –No Residential component. |
| MM T-4 | Proximity to bike path/bike lanes | | Yes – per DEIR Transportation Section, Class I, II and III bike routes exist in the area. |
| MM T-5 | Pedestrian network | 1 percent – 10 percent | Yes – per DEIR Transportation Section, Pedestrian facilities include sidewalks, crosswalks, and pedestrian signals. Sidewalks are provided on all of the existing roadways in the study area. |
| MM T-6 | Pedestrian barriers minimized | | |
| MM T-7 | Bus Shelter for Existing/Planned Transit Service | 1 percent – 2 percent | Yes – per DEIR Transportation Section, the Project would install AC Transit shelters at two relocated stops on 20 th Street. |
| MM T-8 | Traffic Calming | 1 percent - 10 percent | Not applicable to commercial office building located in an urban area. |
| MM T-9 | Paid Parking | 1 percent – 30 percent | This could be a consideration of the TDM Plan and as such represents a potential additional mitigation measure. |
| MM T-10 | Minimum Parking | 1 percent – 30 percent | Yes -The Proposed Project would have a parking demand deficit of 238 spaces per the Transportation Section of the DEIR. |
| MM T-11 | Parking Reduction beyond Code/Shared Parking | 1 percent – 3- percent | Not Applicable -The Municipal Code specifies the Project is not required to provide any off-street parking because of its location in a C-55 / S-17 zoning district. However, the Proposed Project would have a parking demand deficit of 238 spaces per the Transportation Section of the DEIR. |
| MM T-12 | Pedestrian pathway through parking | 1 percent - 4 percent | Not Applicable. The project includes subterranean parking levels which would not be an impediment to pedestrian travel. |
| MM T-13 | Off Street Parking | 1 percent – 4 percent | Yes - Design of the Proposed Project provides for off street parking. |
| MM T-14 | Parking Area Tree Cover (50 percent cover in ten years) | 3.1 kg/m ³ of canopy | Not Applicable. The project includes subterranean parking levels which would not be exposed to sunlight. |
| MM T-15 | Valet Bicycle Parking | Low | Not Applicable – project is not an event center. |
| MM T-16 | Garage Bicycle Storage | Low | Not Applicable – Project is not residential. |
| MM T-17 | Preferential Parking for EVs/CNG Vehicles | Low | Yes – This required by CALGreen section 5.106.5.2. |

TABLE 7
CAPCOA-IDENTIFIED GHG MITIGATION MEASURES

| Mitigation Measure | Description | Reduction Estimate | Existing or proposed by the project? |
|---------------------------|--|---------------------------|---|
| MM T-18 | Reduced/No Parking Fee for EVs/CNG Vehicles | Low | No –This measure represents a potential additional mitigation measure. |
| MM T-19 | TMA Membership | 1 percent – 28 percent | Yes - Project will prepare aTDM implementation as SCA TRANS-1, however, details of the TDM Plan are not established and no GHG reduction estimate from implementation of the TDM Plan was considered in the inventory. Consequently, this measure represents a means by which further GHG emission reductions may be realized. |
| MM T-20 | Use or provide ULEV | Low | Not Applicable – No applicant vehicle fleet that can feasibly operate on hybrid or electric power. |
| MM T-21 | Flex Fuel Vehicles | Low | Not Applicable – No applicant vehicle fleet. |
| MM D-1 | Office/ Mixed Use Density | 0.05 percent – 2 percent | Yes – Project provides office and retail use proximate to transit with bicycle and pedestrian access. |
| MM D-2 | Orientation to Existing/Planned Mass Transit | 0.4 percent – 1 percent | Yes – DEIR Transportation Section states that the site is located approximately 0.25 mile of the 19 th Street BART station. AC Transit provides bus service to the project site. |
| MM D-3 | Services Operational – for Employees | 0.5 percent – 5 percent | Yes - Operational features include retail space restaurants and a fitness center. |
| MM D-4 | Residential Density | 1 percent – 40 percent | Not Applicable – Project is not residential. |
| MM D-5 | Street Grid | 1 percent | Not Applicable to non-residential projects. |
| MM D-6 | Neighborhood Electric Vehicle Access | 0.5 percent – 1.5 percent | Not Applicable to non-residential project. |
| MM D-7 | Affordable Housing Component | 0.4 percent – 6 percent | Not Applicable – Project is not residential. |
| MM D-8 | Recharging Area | Low | Not Applicable – Project is not residential. |
| MM D-9 | Urban Mixed Use Development | 3 percent - 9 percent | Yes - Development predominantly characterized office and retail uses that are combined in two buildings on a single site in an integrated development project with functional interrelationships. |
| MM D-10 | Suburban Mixed Use Development | 3 percent | Not Applicable – Project is urban not suburban (see MM D-9) |
| MM D-11 | Other Mixed Use Development | 1 percent | Not Applicable to non-residential project. |
| MM D-12 | Infill Development | 3 percent - 30 percent | Not Applicable – Project is not located on a vacant infill site, brownfield or greyfield. |
| MM D-13 | Electric Lawnmower Provided to Residents | 1 percent | Not Applicable – Project is not Residential. |
| MM D-14 | Enhanced Recycling | Low | Construction : Yes – DEIR Project Description states that the Project Applicant proposes to establish a construction debris recycling program throughout demolition and construction of the project which would assume 50 percent materials recycled or reused. Concrete materials, in particular, not needed for the Proposed Project would be hauled from the site for recycled material reuse. |

TABLE 7
CAPCOA-IDENTIFIED GHG MITIGATION MEASURES

| Mitigation Measure | Description | Reduction Estimate | Existing or proposed by the project? |
|--------------------|--|-------------------------|--|
| | | | Operation: -No. In terms of operational elements, while the City has adopted a zero-waste resolution there are no operational project recycling goals. Operational recycling goals represent a potential additional mitigation measure |
| MM D-15 | LEED Certification | Moderate | Partially – The Proposed Project will be designed to CALGreen standards. These standards require a reduction over existing Title 24 energy standards as well as water demand reductions. CALGreen standards do not contain specificity with regard to measures or building techniques to be implemented. Therefore, LEED certification and its corresponding measures represent a potential for further GHG reductions. |
| MM D-16 | Retro-Commissioning: Building systems perform interactively to optimize energy performance | 8 percent – 10 percent | No –This measure represents a potential additional mitigation measure. However it may be a technique to achieve CALGreen standards proposed by the Project. |
| MM D-17 | Drought tolerant Landscaping and shade trees | Low | Partially – shade trees are proposed for 20 th , 21 st and Webster Streets. There is no specificity regarding landscaping. Consequently drought-tolerant landscaping represents potential additional mitigation measure. |
| MM D-18 | Local Farmers Market | Low | Not Applicable to retail/office project. |
| MM D-19 | Community Gardens | Low | Not Applicable to retail/office project. |
| MM E-1 | High-Efficiency Pumps | Low | No –This measure represents a potential additional mitigation measure. |
| MM E-2 | Wood Burning Fireplaces/Stoves | Low | Not Applicable to retail/office project. |
| MM E-3 | Natural Gas Stove | Low | Not Applicable to retail/office project. |
| MM E-4 | Energy Star Roof | 0.5 percent – 1 percent | No –This measure represents a potential additional mitigation measure. |
| MM E-5 | On-Site Renewable Energy System | 1 percent – 3 percent | No –This measure represents a potential additional mitigation measure. |
| MM E-6 | Exceed Title 24 | 1 percent | Yes – CALGreen standards require exceeding existing Title 24 requirements by 15%. |
| MM E-7 | Solar Orientation | Low | Not feasible for high rise towers – This measure cannot be implemented for high rise towers because by design they require exposure from all directions to maximize natural light and view shed. |
| MM E-8 | Non-roof Surfaces - Provide light-colored pavement for at least 30 percent of the site's non-roof impervious surfaces, including parking lots, walkways, plazas, OR place a minimum of 50 percent of parking spaces underground or covered by structured parking | Low | Yes – Non-roof surfaces would be landscaped gardens. Parking areas would be subterranean. |

TABLE 7
CAPCOA-IDENTIFIED GHG MITIGATION MEASURES

| Mitigation Measure | Description | Reduction Estimate | Existing or proposed by the project? |
|---------------------------|---|---------------------------|--|
| MM E-9 | Low-energy Cooling (Separate ventilation and Cooling systems) | 1 percent – 10 percent | No –This measure represents a potential additional mitigation measure. |
| MM E-10 | Install Vegetated Green Roof | 1 percent | No –However, this measure would compete for roof space with Measures E-4 and E-5 and would be unrealistic for a high-rise building and is not suggested as an additional mitigation measure. |
| MM E-11 | Charging Facilities | Low | No –This measure represents a potential additional mitigation measure. |
| MM E-12 | Light-colored Paving | Low | Not applicable to a high rise commercial building with subterranean parking. |
| MM E-13 | Cool Roof | Low | No –However, MM E-4 requires Energy Star roofs which are low emissivity materials¹⁰. This measure does not represent an additional mitigation measure with implementation of MM E-4. |
| MM E-14 | Solar Water Heaters | 20 percent – 70 percent | Not applicable for institutional complex with central boiler. |
| MM E-15 | Electric Yard Equipment Compatibility | Low | No –This measure represents a potential additional mitigation measure. |
| MM E-16 | Energy Efficient Appliance Standards | Low | Not Applicable to retail/office project. |
| MM E-17 | Green Building Materials | Low | No –This measure represents a potential additional mitigation measure. |
| MM E-18 | Shading Mechanisms for windows, patio and walkway overhangs | Low | No –This measure represents a potential additional mitigation measure. |
| MM E-19 | Ceiling/whole-house fans | Low | Not Applicable to retail/office project. |
| MM E-20 | Programmable Thermostats | Low | No –This measure represents a potential additional mitigation measure. |
| MM E-21 | Passive Heating and Cooling Systems | Low | Not applicable for high rise towers. High rise towers would be exposed to summer sunlight in all directions and would require more than just a passive cooling system. Similar considerations or winter heating based on concrete and steel substructure necessary for high-rise towers. |
| MM E-22 | Day Lighting Systems | Low | Not applicable – High rise towers are designed to receive sunlight from all directions. CAPCOA indicates that this measure has “little benefit in multi-floor buildings”. |
| MM E-23 | Low- Water Use Appliances | Low | Yes – This measure would be a requirement of CALGreen Standards. |
| MM E-24 | Goods Transport by Rail | Moderate | Not Applicable to retail/office project. |
| MM S-1 | Emissions Reduction Education | Low | No –This measure represents a potential additional mitigation measure. |
| MM S-2 | School Curriculum | Low | Not Applicable to retail/office project. |

TABLE 7
CAPCOA-IDENTIFIED GHG MITIGATION MEASURES

| Mitigation Measure | Description | Reduction Estimate | Existing or proposed by the project? |
|--------------------|---------------------------------|--------------------|---|
| MM M-1 | Off-Site Mitigation Fee Program | Moderate | The BAAQMD does not have a fee mitigation program for GHG. CARB's cap and trade program is not scheduled for launch until 2012. CAPCOA identifies this measure as not logistically feasible at present. |
| MM M-2 | Offset Purchase | Low | Not Applicable (As noted above, CARB is developing a cap and trade program but it is not scheduled for launch until 2012). CAPCOA identifies this measure as not logistically feasible at present. |

SOURCE: CAPCOA, 2009.

8.0 GHG Reduction Measures Identified in the Bay Area Air Quality Management District (BAAQMD) Proposed CEQA Air Quality Guidelines

The BAAQMD's CEQA Air Quality Guidelines contains tables of mitigation measures to reduce operational-related emissions of GHG's from mobile, area and stationary sources in Section 4.3 of the document. These measures include reduction estimates applicable to each measure. **Table 8** presents an itemized list of each of the project-specific mitigation measures identified in by BAAQMD and correlates them to any existing or Proposed Project elements. Mitigation measures which are not proposed by the project or identified as a Standard Condition of Approval or Mitigation Measure in the DEIR are then identified as potential GHG reduction measures if they are deemed applicable to the type of project proposed.

TABLE 8
BAAQMD-IDENTIFIED GHG MITIGATION MEASURES

| Mitigation Measure | Description | Reduction Estimate | Existing or proposed by the project? |
|--------------------|---|------------------------|---|
| 1 | Mix of Uses | -3 percent – 9 percent | Yes, residential within ½ mile |
| 2 | Local Serving Retail within ½ mile of Project | 2 percent | Yes |
| 3 | Transit Service | 0 percent – 15 percent | Yes – DEIR Transportation Section states that the site is located approximately 0.25 mile of the 19 th Street BART station. AC Transit provides bus service to the project site. |
| 4 | Bike & Pedestrian | 0 percent - 9 percent | Yes – per DEIR Transportation Section, Class I, II and III bike routes exist in the area. |
| 5 | Affordable Housing | 0 percent – 4 percent | Not Applicable to retail/office project. |

TABLE 8
BAAQMD-IDENTIFIED GHG MITIGATION MEASURES

| Mitigation Measure | Description | Reduction Estimate | Existing or proposed by the project? |
|--------------------|--|--|--|
| 6 | Daily Parking Charge | 0 percent – 25 percent | This could be a consideration of the TDM Plan and as such represents a potential additional mitigation measure. |
| 7 | Parking Cash-out. California law requires certain employers who provide subsidized parking for their employees to offer a cash subsidy to employees who do not drive, in lieu of a parking space | 0 percent – 12.5 percent | No –This measure represents a potential additional mitigation measure. |
| 8 | Free Transit Passes | 25 percent of transit service reduction | No –This measure represents a potential additional mitigation measure. |
| 9 | Employee Telecommuting Program | 1 percent – 100 percent | Not feasible for a commercial building where tenants are not yet identified. |
| 10-12 | Compressed Work Schedule | 1 percent – 40 percent | Not feasible for a commercial building with multiple tenants that are not yet identified. |
| 13 | Secure Bike Parking | 3 or more elements = 1percent; 5 or more = 2 percent reduction | Yes bicycles per SCA TRANS 2 the applicant shall submit for review and approval of the Planning and Zoning Division, plans that show bicycle storage and parking facilities to accommodate 75 short-term bicycle parking spaces onsite or on public sidewalk, and 136 long-term bicycle parking spaces |
| 14 | Showers/Changing facilities provided | | Yes – Showers (20) and lockers (80) to be installed for office uses per Table 4.L-18 of the DEIR. |
| 15 | Guaranteed Ride Home Program provided | | Yes – Alameda County has this program available to all employers and employees in the County |
| 16 | Car sharing services provided | | No –This measure represents a potential additional mitigation measure. |
| 17 | Information provided on transportation alternatives | | No –This measure represents a potential additional mitigation measure. |
| 18 | Dedicated employee transportation coordinator | | No –This measure represents a potential additional mitigation measure. |
| 19 | Carpool matching program | | No –This measure represents a potential additional mitigation measure. |
| 20 | Preferential carpool/vanpool parking | | No –This measure represents a potential additional mitigation measure. |
| 21 | Parking supply | 0-50 percent | Yes -The Proposed Project would have a parking deficit of 416 spaces per the Transportation Section of the DEIR. |
| 22 | On Road trucks | URBEMIS determination | Not Applicable to retail/office project |
| 23 | Increase energy efficiency beyond Title 24 | Equal to percentage increase beyond Title 24 | Yes – CALGreen standards require exceeding existing Title 24 requirements by 15%. |
| 24 | Electrically powered landscape equipment and electrical outlets | Equivalent to URBEMIS estimated emissions | No –This measure represents a potential additional mitigation measure. |

TABLE 8
BAAQMD-IDENTIFIED GHG MITIGATION MEASURES

| Mitigation Measure | Description | Reduction Estimate | Existing or proposed by the project? |
|--------------------|---|--|--|
| 26 | Plant shade trees within 40 feet of the south side or within 60 feet of the west sides of properties | 30 percent | Yes – shade trees are proposed for 20 th , 21 st and Webster Streets. |
| 27 | Require cool roof materials | 34 percent | No –However, MM E-4 requires Energy Star roofs which are low emissivity materials¹¹. This measure does not represent an additional mitigation measure with implementation of MM E-4. |
| 28 | Install green roofs | 1 percent | No –However, this measure would compete for roof space with Measures E-4 and E-5 and would be unrealistic for a high-rise building and is not suggested as an additional mitigation measure. |
| 29 | Require smart meters and programmable thermostats | 10 percent | Installation of Smart Meters would not reduce GHG emissions. Installation of programmable thermostats is addressed in CAPCOA Measure E-20. |
| 30 | Meet GBC standards in all new construction | 3 percent – 17 percent | Yes. Buildings will be built to CALGreen standards. |
| 32 | Install solar water heaters | 70 percent | Not Applicable to retail/office project.` |
| 33 | Install tankless water heaters | 35 percent | Not Applicable to retail/office project.` |
| 34 | Install solar panels on residential and commercial buildings | 100 percent | No –However, CAPCOA MM E-5 discusses solar energy systems. This measure does not represent an additional mitigation measure with implementation of MM E-5. |
| 35 | 100% increase in diversity of land use mix | 5 percent | Not Applicable to retail/office project.` |
| 36 | Jobs/housing balance | Trip reduction as determined by traffic consultant | Trip generation estimates considered households and employment for the Study area. Not a true mitigation measure, given the project location is not changeable. |
| 37 | 100% increase in design (i.e., presence of design guidelines for transit oriented development, complete street standards | 3 percent | Yes – per DEIR Transportation Section, the Project would relocate two AC Transit stops on 20 th Street and add shelter. The site is located approximately 0.5 mile of the 19 th Street BART station. AC Transit provides bus service to the project site |
| 38 | 100% increase in density | 5 percent | Yes – Per DEIR Project Description, project will increase total useable floor area on the project site by 92 percent. |
| 39 | HVAC duct sealing | 30 percent | Yes -this measure is required by section 5.504.3 of the CALGreen mandatory standards for commercial buildings. |
| 40 | Provide necessary infrastructure and treatment to allow use of 50% greywater/recycled water in residential and commercial uses for outdoor irrigation | 6 percent | No – However, per DEIR Utilities section pp. IV.M-10, , EBMUD has stated that recycled water service is not recommended for the type of project proposed . |

¹¹ http://www.energystar.gov/index.cfm?c=roof_prods.pr_roof_emissivity

TABLE 8
BAAQMD-IDENTIFIED GHG MITIGATION MEASURES

| Mitigation Measure | Description | Reduction Estimate | Existing or proposed by the project? |
|--------------------|---|----------------------|--|
| 41 | Complete streets | 1percent – 5 percent | Not Applicable to retail/office project |
| 42 | Maximize interior daylight | None Given | Not applicable – High rise towers are designed to receive sunlight from all directions. CAPCOA indicates that this measure has “little benefit in multi-floor buildings” . . |
| 43 | Increase roof/ceiling insulation | None Given | No –This measure represents a potential additional mitigation measure. However it may be a technique to achieve CALGreen standards proposed by the Project. |
| 45 | Install rainwater collection systems in commercial buildings | None Given | No –This measure represents a potential additional mitigation measure. |
| 46 | Install low-water use appliances and fixtures | None Given | Yes –CALGreen standards would require low flow, water efficient fixtures |
| 47 | Restrict the use of water for cleaning outdoor surfaces/prohibit systems that apply water to non-vegetated surfaces | None Given | No –This measure represents a potential additional mitigation measure. |
| 48 | Implement water-sensitive urban design practices in new construction | None Given | No –This measure represents a potential additional mitigation measure. However it may be a technique to achieve CALGreen standards proposed by the Project. |
| 50 | Create food waste and green waste curb-side collection service | None Given | Not Applicable to retail/office project |
| 51 | Require provision of storage areas for recyclables and green waste in new construction | None Given | No –This measure represents a potential additional mitigation measure. |

9.0 Summary of Additional GHG Reduction Measures Considered for the Proposed Project

The following Table 9 summarizes the available additional GHG reduction measures identified in Sections 6.0 through 8.0 above. These listed were identified as those not already assumed as part of the Project and that could be considered for implementation development and operation of the Project to further increase energy efficiency and reduce GHG emissions from the Project to the greatest extent practical and feasible. As previously indicated, available and feasible reduction measures would not be limited to those listed in Table 9; given the evolving nature of GHG emissions reduction strategies and technologies, there is some uncertainty involved with the identification and effectiveness of available GHG reduction measures. Further, additional measures may be feasible (or less so) as the Project is developed in greater detail. Overall, a “comprehensive set of quantified additional GHG reduction

measures available to further reduce GHG emissions beyond the adjusted GHG emissions” that may include but not be limited to a combination of the available measures in Table 9 would constitute a GHG Emissions Reduction Plan for the Project.

A preliminary estimate of emissions reductions is presented for some measures. For others a quantifiable emission reduction cannot be reasonably estimated given the available details of the Project or are insubstantial because the emissions would be minimal. However, these measures are still identified for possible implementation by the Project (as the GHG Emissions Reduction Plan) to ensure emissions reduction to the greatest extent feasible below the BAAQMD CEQA Thresholds of Significance (1,100 metric tons of CO₂e per year and 4.6 metric tons of CO₂e per year per service population), pursuant to Mitigation Measure AIR-3 and Standard Condition of Approval GHG-1 identified in the EIR for the Project..

Following Table 9 is an individual assessment of the feasibility, applicability and GHG emissions reduction potential of each of these additional reduction measures identified.

TABLE 9
ADDITIONAL GHG REDUCTION MEASURES IDENTIFIED FOR POTENTIAL IMPLEMENTATION BY THE PROPOSED PROJECT

| Mitigation Measure | Description | CO ₂ e Emissions Reduction Estimate Range |
|--------------------|---|--|
| CAPCOA MM T-9 | Paid Parking ^a | 1 percent – 30 percent |
| CAPCOA MM T-18 | Reduced/No Parking Fee for EVs/CNG Vehicles | Low |
| CAPCOA MM T-19 | TMA Membership ^a | 1 percent – 28 percent |
| CAPCOA MM D-14 | Enhanced Recycling | Low |
| CAPCOA MM D-15 | LEED Certification ^b | Moderate |
| CAPCOA MM D-16 | Retro-Commissioning | 8 percent – 10 percent |
| CAPCOA MM D-17 | Drought-tolerant Landscaping | Low |
| CAPCOA MM E-1 | High-Efficiency Pumps | Low |
| CAPCOA MM E-4 | Energy Star Roof | 0.5 percent – 1 percent |
| CAPCOA MM E-5 | On-Site Renewable Energy System | 1 percent – 3 percent |
| CAPCOA MM E-9 | Low energy Cooling | 1 percent – 10 percent |
| CAPCOA MM E-11 | Charging Facilities | Low |
| CAPCOA MM E-15 | Electric Yard Equipment Compatibility | Low |
| CAPCOA MM E-17 | Green Building Materials | Low |
| CAPCOA MM E-18 | Shading Mechanisms for windows, patio and walkway overhangs | Low |
| CAPCOA MM E-20 | Programmable Thermostats | Low |
| CAPCOA MM S-1 | Emissions Reduction Education | Low |
| CAPCOA MM M-2 | Offset Purchase | Up to 100 percent |
| BAAQMD MM 6 | Daily Parking Charge ^{a,c} | 0 percent - 25 percent |
| BAAQMD MM 7 | Parking Cash-out. California law requires certain employers who provide subsidized parking for their employees to offer a cash subsidy to employees who do not drive, in lieu of a parking space ^a | 0 percent – 12.5 percent |
| BAAQMD MM 8 | Free Transit Passes ^a | 25 percent of transit service reduction |
| BAAQMD MM 16 | Car sharing services provided ^a | 1 percent additional mobile source reduction with implementation of these 5 additional TDM Measures together |
| BAAQMD MM 17 | Information Provided on Transportation Alternatives ^a | 1 percent additional mobile source reduction with implementation of these 5 additional TDM Measures together |
| BAAQMD MM 18 | Dedicated Employee Transportation Coordinator ^a | |
| BAAQMD MM 19 | Carpool Matching Program ^a | |
| BAAQMD MM 20 | Preferential Carpool/Vanpool Parking ^a | |
| BAAQMD MM 24 | Electrically powered landscape equipment and electrical outlets | Equivalent to URBEMIS estimated emissions |

| Mitigation Measure | Description | CO ₂ e Emissions Reduction Estimate Range |
|--------------------|---|--|
| BAAQMD MM 43 | Increase Roof/Ceiling Insulation | BAAQMD provides no emissions reduction range |
| BAAQMD MM 45 | Install rainwater collection systems in commercial buildings | BAAQMD provides no emissions reduction range |
| BAAQMD MM 47 | Restrict the use of water for cleaning outdoor surfaces/prohibit systems that apply water to non-vegetated surfaces | BAAQMD provides no emissions reduction range |
| BAAQMD MM 48 | Implement water-sensitive Urban Design Practices in New Construction | BAAQMD provides no emissions reduction range |
| BAAQMD MM 51 | Require the Provision of storage areas for recyclables and green waste in new construction | BAAQMD provides no emissions reduction range |

^a To be estimated with SCA TRANS-1, which requires preparation of a TDM incorporating a variety of measures aimed at reducing SOV trips generated by the Project.

^b While LEED certification is not being proposed for the Project, Voluntary Tier CALGreen standards may be identified.

^c Addressed In CAPCOA Measure T-9.

SOURCE: ESA, 2010

- 9.1 CAPCOA Mitigation Measure T-9: Paid Parking.** This measure would provide an employee and/or customer paid parking system. Project must have a permanent and enforceable method of maintaining user fees for all parking facilities. The facility may not provide customer or employee validations. Daily charge for parking must be equal to or greater than the cost of a transit pass plus 20 percent. This measure would reduce trip generation and could be a component of the required TDM Plan. The estimated reduction of trip generation (and associated GHG emissions) is best determined by the traffic consultant preparing the TDM Plan. BAAQMD estimates an employee trip reduction benefit of 0 to 25 percent with this measure.
- 9.2 CAPCOA Mitigation Measure T-18: Reduced Parking Fee for EV/CNG Vehicles.** This measure would reward and encourage the use of low GHG emission vehicles. CAPCOA indicates that this measure has a low reduction score and does not quantify any emissions reduction related to this measure. Consequently, this measure is suggested to be implemented but no quantifiable reduction in transportation-related emissions can reliably be estimated.
- 9.3 CAPCOA Mitigation Measure T-19: TDM Membership.** This measure would require permanent TMA membership and funding requirement. Funding to be provided by Community Facilities District or County Service Area or other non-revocable funding mechanism. TDMs have been shown to reduce employee vehicle trips up to 28 percent with the largest reductions achieved through parking pricing and transit passes. The impact depends on the

travel alternatives. These trip reductions will be detailed in the TDM Plan to be prepared for the Project (pursuant to SCA TRANS-1), and the resulting vehicle trip and related GHG emissions reductions will be calculated.

9.4 CAPCOA Mitigation Measure D-14: Enhanced Recycling. This measure would provide infrastructure/education that promotes the avoidance of products with excessive packaging, recycle, buying of refills, separating of food and yard waste for composting, and using rechargeable batteries. CAPCOA indicates that this measure has a low reduction score and does not quantify any emissions reduction related to this measure. Consequently, this measure is suggested to be implemented but no quantifiable reduction in GHG emissions can reliably be estimated.

9.5 CAPCOA Mitigation Measure D-15: LEED Certification. The Proposed Project will be designed to the CALGreen building standards which when adopted on January of 2011. While LEED certification is not being proposed for the Project towers, they nonetheless are proposed to be built to CALGreen standards. For the purpose of meaningful GHG emissions reduction calculations, CALGreen standards for commercial buildings would result in 15 percent less energy demand and 20 percent reduced water demand than a standard building built to 2008 Title 24 standards. Therefore, for the purpose of estimating an emissions inventory, CALGreen is equivalent to a LEED “silver” rating in terms of meaningful emissions reductions. CALGreen is assumed in the adjusted baseline emissions for the Project reported in the Project’s baseline emissions discussed previously. More aggressive LEED certification (“gold” or “platinum”) would further increase efficiency and further reduce GHG emissions.

9.6 CAPCOA Mitigation Measure E-5: On-site Renewable Energy System. This measure would provide onsite renewable energy system(s). Nonpolluting and renewable energy potential includes solar, wind, geothermal, low-impact hydro, biomass and bio-gas strategies. When applying these strategies, projects may take advantage of net metering with the local utility. Of these strategies, the most common for commercial building applications in an urban environment would be solar. The effectiveness of a solar energy system for the Proposed Project would be restricted by the available roof space and the need for other ancillary equipment on the rooftop.

With regard to feasibility of this measure, it should be noted that in a March 30, 2010 press release, Kaiser Permanente announced its intention to install 15 megawatts of solar power systems¹² on its hospitals, medical offices and other buildings at 15 locations in California. Kaiser estimates that installation of solar power systems will provide for 10 percent of electricity demand for its buildings at each location. Lowering this reduction goal to 5 percent to account for rooftop space limits the estimate of the potential GHG reductions resulting if such a measure was implemented for the Proposed Project, a potential reduction of 176 MT/year of CO₂e would be possible.

9.7 CAPCOA Mitigation Measure E-9: Low Energy Cooling. This measure would require the Project to optimize the buildings thermal distribution by separating ventilation and

¹² <http://xnet.kp.org/newscenter/pressreleases/nat/2010/033010solarpower.html>

thermal conditioning systems. CAPCOA estimates a 1 to 10 percent reduction in energy demand through implementation of this measure. Applying the lower end of this estimated reduction goal as an estimate of the potential GHG reductions if such a measure was to be implemented for the proposed Project, a potential reduction of 35.3 MT/year of CO₂e would be possible

- 9.8 CAPCOA Mitigation Measure E-11: Charging Facilities.** This measure would require the Project to install electric vehicle charging facilities. CAPCOA indicates that this measure has a low reduction score and does not quantify any emissions reduction related to this measure. Consequently, this measure is suggested to be implemented but no quantifiable reduction in GHG emissions can reliably be estimated.
- 9.9 CAPCOA Mitigation Measure E-15: Electric Yard Equipment Compatibility.** This measure would require provision of electrical outlets at building exterior areas. CAPCOA indicates that this measure has a low reduction score and does not quantify any emissions reduction related to this measure. Consequently, this measure is suggested to be implemented but no quantifiable reduction in GHG emissions can reliably be estimated.
- 9.10 CAPCOA Mitigation Measure E-17: Green Building Materials.** This measure would require the Project to use materials which are resource efficient, recycled, with long life-cycles and manufactured in an environmentally friendly way. This measure addresses lifecycle GHG emissions which are not a consideration relative to CEQA. Consequently, this measure is suggested to be implemented but no quantifiable reduction in GHG emissions would be applicable to the Project inventory.
- 9.11 CAPCOA Mitigation Measure E-18: Shading Mechanisms for Windows, Patios and Walkway Overhangs.** This measure would require installation of energy-reducing shading mechanisms for windows, porch, patio and walkway overhangs. CAPCOA cites an estimate the savings of this measure to be \$450 per year. Based on a commercial electrical rate of 0.18 dollars per kw-hr represents approximately 2,500 kw-hr per year or about 0.6 MT/year of CO₂e.
- 9.12 CAPCOA Mitigation Measure E-20 Programmable Thermostats.** This measure would require the Project to install energy-reducing programmable thermostats that automatically adjust temperature settings. CAPCOA cites an estimate the savings of this measure to be \$100 per year. Based on a commercial electrical rate of 0.18 dollars per kw-hr represents approximately 556 kw-hr per year or about 0.13 MT/year of CO₂e.
- 9.13 CAPCOA Mitigation Measure S-1: Emission reductions Education.** This measure would require the Project to provide businesses with guidance/protocols/information on how to reduce GHG emissions. CAPCOA indicates that this measure has a low reduction score and does not quantify any emissions reduction related to this measure. Consequently, this measure is suggested to be implemented but no quantifiable reduction in GHG emissions can reliably be estimated.
- 9.14 CAPCOA Mitigation Measure M-2: Offset Purchase.** This analysis considers Offset Purchase (CAPCOA Mitigation Measures M-2) to be a potentially feasible measure,

despite CAPCOA's indication that it is "logistically feasible at present", given that Phase 1 of the Project would not be operational until approximately 2016, and Phase 2 or Project Buildout could be up to an additional several years after that (approximately 2-3 years assumed in this analysis), and given the potential for implementation of this measure to have a "Moderate/High" reduction estimate.

There is recognized uncertain in the current state of carbon markets (including the availability and pricing of offsets) in the U.S. With a federal climate bill languishing in the Senate, and emerging political challenges to AB 32 it is difficult at best to characterize supply and demand in yet-to-be-created carbon market, and even more difficult to predict the price of emissions allocations or offsets. A national cap and trade system, where buyers and sellers determine a market price for allocations and offsets, is still a possibility at the national level, and has a strong likelihood of developing in California (through AB 32) and other Western states (through the Western Climate Initiative). Currently in California, buyers purchase offsets either to reduce their carbon footprint voluntarily, or as a "pre-compliance" strategy with the hope that they can use them in a future cap-and-trade system. Prices have remained relatively low over the past year or two due to the sluggish economy and the policy uncertainty. They are certain to rise significantly if and when federal, regional, and/or state cap-and-trade becomes a reality.

The AB 32 Scoping Plan identifies cap-and-trade as a key strategy for helping California reduce its GHG emissions, but ARB still has not yet indicated how the system will work. Consistent with AB 32, ARB must adopt the cap-and-trade regulation by January 1, 2011, and the program itself must begin in 2012. At the time of this writing it is not known how such a system would distribute allocations to those who fall under the cap, and how offsets could be used to reduce emissions against the cap. It is also unclear whether ARB will operate their own cap-and-trade program or contract the program to a third party, and if the program will link to external registries of approved carbon offset credits.

Despite the various uncertainties, several registries of carbon reduction projects (representing carbon credits) have emerged in the United States in recent years. These registries facilitate and give legitimacy to carbon credit tracking and trading. One of the leading registries, the Climate Action Reserve (CAR), is expected to serve as a source of regulatory offsets under the future California program. CAR is a spin-off program of the California Climate Action Registry (CCAR) which was created by California state legislation in 2001 and has been closely involved with ARB throughout the AB 32 implementation process, including the development of its reporting rule, verification scheme, and many sector accounting protocols. CAR is also recognized in the Kerry-Boxer and Waxman-Markey climate bills as eligible for providing offset credits to the federal cap-and-trade system. CAR is respected as a national project registry that sets standards, accredits verifiers, and registers and tracks projects using sophisticated software to serialize and transfer emission reduction credits. In 2009, CAR transactions accounted for the majority of the US offset market value, and CAR Climate Reserve Tons (CRTs) usually command a premium over the general voluntary offset market.

Newly enacted CEQA Guidelines Section 15126.4 (c), adopted March 18, 2010 expressly provides for this as mitigation to reduce GHG emissions.

9.15 BAAQMD Mitigation Measure 6: Daily Parking Charge. This measure would require parking fees for all employees to discourage daily vehicle trips and promote use of transit. These will be detailed in the TDM Plan for the Project., and the resulting vehicle trip and related GHG emissions reductions will be calculated. Employee trips represent 35 percent of trip generation based on URBEMIS2007 data for office buildings.

9.16 BAAQMD Mitigation Measure 7: Parking Cash-out. This measure would require employers who provide subsidized parking for their employees to offer a cash subsidy to employees who do not drive, in lieu of a parking space. This measure would reduce employee trips only, not visitor trips. BAAQMD estimates an employee trip reduction benefit of 0 to 12.5 percent with this measure. Employee trips represent 35 percent of trip generation based on URBEMIS2007 data for office building. Assuming an average of 6 percent reduction in employee trips, implementation of this measure would reduce Phase 1 emissions by 192 MT/year of CO₂e .

Employee trips represent 7 percent of MOB trip generation based on URBEMIS2007 data for medical office buildings. Assuming an average of 6 percent reduction in employee trips, implementation of this measure would reduce remaining future phase emissions by 21.1 MT/year of CO₂e .

9.17 BAAQMD Mitigation Measure 8: Free Transit Passes. This measure would require employers to provide free transit passes to employees. BAAQMD estimates that this measure would result in a further 25 percent of the existing transit service reduction. Thirty percent of employees take BART or buses to the Project site, according to the DEIR Transportation section. A 25 percent increase in this rate would result in 37.5 percent of employees taking transit. Given the Proposed Project results in 3,233 total employees with the Project. The additional 7.5 percent increase in employee transit ridership resulting from this measure would remove approximately 242 employees from daily vehicle trips to work. Assuming each employee who drives to work generates 2.5 vehicle trips per day, this measure would remove approximately 605 vehicle trips per day. Based on URBEMIS2007 emission rates, this trip reduction would reduce GHG emissions by 695 MT/year of CO₂e.

9.18 BAAQMD Mitigation Measure 16: Car Sharing Services Provided. BAAQMD identifies this measure along with a menu of seven other TDM measures as reducing GHG emissions synergistically as a group. The degree of benefit estimated, depends on the number of TDM measures included from the menu. As this measure and the following four measures (BAAQMD 17 -20) of the of the total eight TDM measures on the menu that are not already identified as in operation, the potential GHG reduction benefits for these measures are considered together. Together, these five additional TDM measures were assumed to result in an additional 1 percent reduction, or about 91.4 MT/year of CO₂e.

9.19 BAAQMD Mitigation Measure 17: Information Provided on Transportation Alternatives. See BAAQMD Measure 16 for discussion on reductions from this TDM measure.

- 9.20 BAAQMD Mitigation Measure 18: Dedicated Employee Transportation Coordinator.** See BAAQMD Measure 16 for discussion on reductions from this TDM measure.
- 9.21 BAAQMD Mitigation Measure 19: Carpool Matching Program.** See BAAQMD Measure 16 for discussion on reductions from this TDM measure.
- 9.22 BAAQMD Mitigation Measure 20: Preferential Carpool/Vanpool Parking.** See BAAQMD Measure 16 for discussion on reductions from this TDM measure.
- 9.23 BAAQMD Mitigation Measure 24: Electrically Powered Landscape Equipment.** BAAQMD identifies this measure as reducing GHG emissions associated with operation of landscape maintenance equipment. This measure is similar to CAPCOA measure E-15 above. If we assume that this measure results in no landscape equipment emissions as calculated in the Projects emissions inventory in Table 3, then implementation of this measure would reduce emissions by 0.24 MT/year of CO₂e.
- 9.24 BAAQMD Mitigation Measure 34: Install Solar Panels on Residential and Commercial Buildings.** This measure is addressed relative to CAPCOA Mitigation Measure E-5 above.
- 9.25 BAAQMD Mitigation Measure 44: Increase Roof/Ceiling Insulation.** This measure is likely to be implemented to achieve the 15 percent energy reduction target recommended by CALGreen standards. BAAQMD does not cite a reduction efficiency associated with this measure. Consequently, this measure is suggested to be implemented but no quantifiable reduction in GHG emissions is estimated.
- 9.26 BAAQMD Mitigation Measure 45: Rainwater Collection Systems in Commercial Buildings.** BAAQMD does not cite a reduction efficiency associated with this measure. Consequently, this measure is suggested to be implemented but no quantifiable reduction in GHG emissions is estimated.
- 9.27 BAAQMD Mitigation Measure 47: Restrict Use of Water for Cleaning Outdoor Surfaces.** BAAQMD does not cite a reduction efficiency associated with this measure. Consequently, this measure is suggested to be implemented but no quantifiable reduction in GHG emissions is estimated.
- 9.28 BAAQMD Mitigation Measure 48: Implement Water-sensitive Urban Design Practices in New Construction.** This measure is likely to be implemented by as a required element of CALGreen commercial building standards. BAAQMD does not cite a reduction efficiency associated with this measure. Consequently, this measure is suggested to be implemented but no quantifiable reduction in GHG emissions is estimated.
- 9.29 BAAQMD Mitigation Measure 51: Require Provision of Storage Areas for Recyclables and Green Waste in New Construction.** BAAQMD does not

cite a reduction efficiency associated with this measure. Consequently, this measure is suggested to be implemented but no quantifiable reduction in GHG emissions is estimated.

Bold indicates significant impact.

Project contributions under Alternative 2 would not exceed thresholds of significance and, therefore, Alternative 2 would not result in significant impacts at the above locations.

- ☐ Landfilling only
 ☒ Landfilling with Flaring to Burn Methane
 ☐ Landfilling with Energy Recovery

Indirect Greenhouse Gas (GHG) Emissions from Alternative 1 Electricity (Power Plant Emissions)

Estimated Proposed Plan Annual Electrical Use: 8,689,936 kWh (kilowatt hours)/year
8,690 mWh (megawatt hours)/year

| Indirect GHG gases | Emission Factor
lb/mWh | Annual | | CO2
Equivalent
Factor | Annual |
|---|---------------------------|----------------------------------|---------------------|-----------------------------|---|
| | | Proposed Plan
Electricity mWh | GHGs
metric tons | | CO2 Equivalent
Emissions (metric tons) |
| eCO2 | 524 | 8,690 | 2,065 | 1 | 2065 |
| Nitrous Oxide (N2O) | 0 | 8,690 | 0.0 | 296 | 0 |
| Methane (CH4) | 0 | 8,690 | 0.0 | 23 | 0 |
| Total Indirect GHG Emissions from Project Electricity Use= | | | | | 2065 |
| Net Increase in GHG Emissions (Alt A -Existing to be Demolished) = | | | | | 1995 |

Alternative 1

Water Usage Emissions

Water Demand = 0.049984 MGD (assumes 44% of Project 0.142 MGD of demand based on area and 20 % reduction from CALGREEN standards
 0.002 MGD water demand for existing uses to be demolished (0.92% less than project)

Water useage = 0.047984 MGD
 = 17.51416 MG/year

Energy use factor = 1450 kWh/MG from CEC 2006 & BAAQMD 2009

Electrical consumption =
 2.54E+04 kW-hr/yr
 2.54E+01 MW-hr/yr

Emission factors for electricity use from California Climate Action Registry General Reporting Protocol January 2009 Version 3.1

| | CO2 | CH4 | N2O |
|-------------------|------------------|------------------|------------------|
| CALI Subregion | 724.12 lbs/MW-hr | 0.0302 lbs/MW-hr | 0.0081 lbs/MW-hr |
| Total Emissions = | 1.84E+04 lb/yr | 7.67E-01 lb/yr | 2.06E-01 lb/yr |

Total emissions as eCO2 =

| | | |
|-----------------|-----------------|-----------------|
| 1.84E+04 lb/yr | 1.61E+01 lb/yr | 6.38E+01 lb/yr |
